ERUPTION. The process of a tooth breaking through the gum tissue to grow into place in the mouth.

ERYTHEMA. The medical term for redness of the skin produced by congestion of the capillaries in the skin.

ERYTHEMA MIGRANS (EM). A red skin rash that is one of the first signs of Lyme disease in about 75% of patients.

ERYTHEMA MULTIFORME. A type of hypersensitivity (allergic) reaction that occurs in response to medications, infections, or illness.

ERYTHROBLASTOPENIA. A deficiency in the cells that create red blood cells. This condition may be severe and life-threatening, but there is a transient form, seen in young children, which resolves spontaneously and does not recur.

ERYTHROBLASTOSIS FETALIS. A disorder of newborn infants marked by a high level of immature red blood cells (erythroblasts).

ERYTHROCYTE SEDIMENTATION RATE (ESR). The rate at which red blood cells settle out in a tube of unclotted blood, expressed in millimeters per hour; elevated sedimentation rates indicate the presence of inflammation.

ERYTHROCYTE. The name for red blood cells or red blood corpuscles. These components of the blood are responsible for carrying oxygen to tissues and removing carbon dioxide from tissues.

ERYTHROCYTOSIS. Increased production of red blood cells.

ERYTHRODERMA. An abnormal reddening of the entire skin surface.

ERYTHROGENIC TOXIN. A toxin or agent produced by the scarlet fever-causing bacteria that causes the skin to turn red.

ERYTHROMYCIN. An antibiotic that can be used instead of penicillin.

ERYTHROPOIESIS. The process through which new red blood cells are created; it begins in the bone marrow.

ERYTHROPOIETIC. Referring to the creation of new red blood cells.

ERYTHROPOIETIN. A hormone produced by the kidneys that stimulates the production of red blood cells by bone marrow.

ESCHAR. A hardened black crust of dead tissue that may form over a wound.

ESCHERICHIA COLI. A type of enterobacterium that is responsible for most cases of severe bacterial diarrhea in the United States.

ESCITALOPRAM OXALATE. An SSRI that is very similar to citalopram hydrobromide.

ESOPHAGEAL ATRESIA. Blockage or closure of the esophagus, the tube leading from the mouth to the stomach.

ESOPHAGEAL MANOMETRY. A test in which a thin tube is passed into the esophagus to measure the degree of pressure exerted by the muscles of the esophageal wall.

ESOPHAGEAL SPHINCTER. A circular band of muscle that closes the last few centimeters of the esophagus and prevents the backward flow of stomach contents.

ESOPHAGEAL VARIX. An enlarged vein of the esophagus. (Plural: esophageal varices.)

ESOPHAGITIS. Inflammation of the esophagus.

ESOPHAGOGASTRODUODENOSCOPY (EGD). A test that involves visually examining the lining of the esophagus, stomach, and upper duodenum with a flexible fiber-optic endoscope.

ESOPHAGOMYOTOMY. A surgical incision through the muscular tissue of the esophagus.

(c) 2011 Cengage Learning. All Rights Reserved.

ESOPHAGOSCOPY (ALSO ESOPHAGOENDOSCOPY). Examination of the inside of the esophagus using a flexible tube that transmits video images.

ESOPHAGUS. The muscular tube that leads from the back of the throat to the entrance of the stomach.

ESSENCE. The constituent of a plant that determines its characteristics.

ESSENTIAL FATTY ACIDS. Sources of fat in the diet, including omega-3 and omega-6 fatty acids.

ESSENTIAL OIL. A volatile oil extracted from the leaves, fruit, flowers, roots, or other components of a plant and used in aromatherapy, perfumes, and foods and beverages.

ESSENTIAL TREMOR. An uncontrollable (involuntary) shaking of the hands, head, and face. Also called familial tremor because it is sometimes inherited, it can begin in the teens or in middle age. The exact cause is not known.

ESTRODIOL. The most physiologically active form of estrogen.

ESTROGEN REPLACEMENT THERAPY (ERT). A treatment in which estrogen is used therapeutically during menopause to alleviate certain symptoms such as hot flashes. ERT has also been shown to reduce the risk of osteoporosis and heart disease in women.

ESTROGEN. A female hormone produced by the ovaries that stimulates the growth of the lining of the uterus.

ETHANOL. The chemical name for beverage alcohol. It is also sometimes called ethyl alcohol or grain alcohol to distinguish it from isopropyl or rubbing alcohol.

ETHINYL ESTRADIOL. A semi-synthetic derivative of estradiol—an estrogen or female sex hormone—used in birth control pills and combined ECPs.

EUPHORIA. An exaggerated state of psychological and physical well-being.

EUSTACIAN TUBE. A tube connecting the middle ear with the back of the nose, allowing air pressure to equalize within the ear whenever it opens, such as with yawning.

EUSTRESS. A term that is sometimes used to refer to positive stress.

EUTHANASIA. The act of putting individuals or animals to death painlessly or allowing them to die by withholding medical services, usually because of an incurable disease; also called mercy killing.

EUTHYROID. Having the right amount of thyroxin stimulation.

EVENT RECORDER. A small machine, worn by a patient usually for several days or weeks, that is activated by the patient to record his or her EKG when a symptom is detected.

EVIDENCE-BASED MEDICINE. Recommendations that are based on an evaluation of randomized, controlled trials; non-randomized trials; other experiments; descriptive studies; and reports of expert committees.

EVISERATED. Removal of eye contents.

EVOKED POTENTIAL. A test of nerve response that uses electrodes placed on the scalp to measure brain reaction to a stimulus such as a touch.

EVULSION. The forceful, and usually accidental, removal of a tooth from its socket in the bone.

EX UTERO INTRAPARTUM TREATMENT (EXIT). A cesarean section in which the infant is removed from the uterus but the umbilical cord is not cut until after surgery for a congenital defect that blocks an air passage.

EXANTHEM (PLURAL, EXANTHEMS OR EXANTHEMATA). A skin eruption regarded as a characteristic sign of such diseases as measles, German measles, and scarlet fever.

EXCIMER LASER. An instrument that is used to vaporize tissue with a cold, coherent beam of light with a single wavelength in the ultraviolet range.

EXCISIONAL BIOPSY. Removal of an entire lymph node; often the most suspicious-looking node is removed for testing.

EXHIBITIONISM. Obtaining sexual arousal by exposing genitals to an unsuspecting stranger.

EXOCRINE. A system of organs that produces chemicals that go through a duct (or tube) to reach other organs whose functioning they affect.

EXOPHTHALMOS. A condition in which the eyes stick out of their sockets and inhibit proper eyelid function.

EXOTOXIN. A poisonous secretion produced by bacilli which is carried in the bloodstream to other parts of the body.

EXPECTORANT. Drug used to thin mucus.

EXPLICIT MEMORY. Conscious recall of facts and events that is classified into episodic memory (involves time and place) and semantic memory (does not involve time and place).

(c) 2011 Cengage Learning. All Rights Reserved.

EXSTROPHY. Being turned inside out combined with being outside the body.

EXTENDED FAMILY FIELD. A person's family of origin plus grandparents, in-laws, and other relatives.

EXTENSIVE SUPPORT. Ongoing daily support required to assist an individual in a specific adaptive area, such as daily help with preparing meals.

EXTENSOR MUSCLES. A group of muscles in the forearm that serve to lift or extend the wrist and hand. Tennis elbow results from overuse and inflammation of the tendons that attach these muscles to the outside of the elbow.

EXTERNAL RADIATION THERAPY. Radiation therapy that focuses high-energy rays from a machine on the area of the tumor.

EXTRACORPOREAL. Outside of, or unrelated to, the body.

EXTRACORPOREAL CIRCUIT (ECC). The path the hemodialysis patient's blood takes outside of the body. It typically consists of plastic tubing, a hemodialysis machine, and a dialyzer.

EXTRACTION. The surgical removal of a tooth from its socket in a bone.

EXTRACTION SITE. The empty tooth socket following removal of the tooth.

EXTRAGONADAL. Occurring outside of the gonads or outside of the reproductive organs.

EXTRAOCULAR MUSCLES. The muscles (lateral rectus, medial rectus, inferior rectus, superior rectus, superior oblique, and inferior oblique) that move the eyeball.

EXTRAOCULAR RETINOBLASTOMA. Cancer that has spread from the eye to other parts of the body.

EXTRAPYRAMIDAL SYMPTOMS (EPS). A group of side effects associated with antipsychotic medications. EPS include parkinsonism, akathisia, dystonia, and tardive dyskinesia.

EXTRINSIC PATHWAY. One of three pathways in the coagulation cascade.

EXTUBATION. Removal of a breathing tube.

EXUDATE. Cells, protein, fluid, or other material that passes through blood vessel walls and accumulates in the surrounding tissue.

F

FACE MASK. The simplest way of delivering a high level of oxygen to patients with ARDS or other low-oxygen conditions.

FACELIFT. Plastic surgery performed to remove sagging skin and wrinkles from an individual's face.

FACIOSCAPULOHUMERAL MUSCULAR DYSTROPHY (FSH). This form of muscular dystrophy, also known as Landouzy–Dejerine condition, begins in late childhood to early adulthood and affects both men and women, causing weakness in the muscles of the face, shoulders, and upper arms.

FACTITIOUS DISEASES. Conditions in which symptoms are deliberately manufactured by patients in order to gain attention and sympathy; also known as factitious disorders.

FACTOR VIII. A protein involved in blood clotting that requires von Willebrand factor for stability and long-term survival in the bloodstream.

FACTOR. Any of several substances necessary to produce a result or activity in the body. The term is used when the chemical nature of the substance is unknown. In endocrinology, when the chemical nature is known, factors are renamed hormones.

FAGET'S SIGN. The simultaneous occurrence of a high fever with a slowed heart rate.

FALLOPIAN TUBES. Part of the internal female anatomy that carries eggs from the ovaries to the uterus.

FALSE NEGATIVE. Test results showing no problem when one exists.

FAMCICLOVIR. An oral antiviral drug that blocks the replication of the varicella zoster virus.

FAMILIAL POLYPOSIS. An inherited condition in which lumps of tissue (polyps) form inside the colon. Familial polyposis may develop into cancer.

FAMILY SYSTEMS THEORY. An approach to treatment that emphasizes the interdependency of family members rather than focusing on individuals in isolation from the family. This theory underlies the most influential forms of contemporary family therapy.

FANCONI'S ANEMIA. An inherited form of aplastic anemia.

FANCONI'S SYNDROME. A kidney disorder in which glucose, amino acids, uric acid, phosphate,

(c) 2011 Cengage Learning. All Rights Reserved.

and bicarbonate are passed into the urine instead of being reabsorbed into the blood.

FARMER'S LUNG. An allergic reaction to moldy hay, most often seen in farmers, that results in lung disease.

FASCIA. The sheet of connective tissue that covers the body under the skin and envelops the muscles and various organs.

FASCIA, DEEP. A fibrous layer of tissue that envelopes muscles.

FASCIA, SUPERFICIAL. A fibrous layer of tissue that lies between the deepest layer of skin and the subcutaneous fat.

FASCICULATIONS. Involuntary twitching of patient's muscles.

FAT. Molecules composed of fatty acids and glycerol; the slowest utilized source of energy, but the most energy-efficient form of food. Each gram of fat supplies about nine calories, more than twice that supplied by the same amount of protein or carbohydrate.

FAT-SOLUBLE VITAMIN. A vitamin that dissolves easily in fat or oil, but not in water. The fat-soluble vitamins are vitamins D, E, A, and K.

FATIGUE. Loss of energy; tiredness.

FATTY LIVER. An abnormal amount of fat tissue in the liver caused by alcohol abuse.

FEBRILE SEIZURE. Convulsions brought on by fever.

FECAL IMPACTION. Obstruction of the rectum by a large mass of feces (stool).

FECES. Bodily waste material that normally passes through the anus.

FELDENKRAIS METHOD. A therapy based on creating a good self image by correction and improvements of body movements.

FELTY'S SYNDROME. An autoimmune disorder in which neutropenia is associated with rheumatoid arthritis and an enlarged spleen.

FEMALE ATHLETE TRIAD. A combination of disorders frequently found in female athletes that includes disordered eating, osteoporosis, and oligo- or amenorrhea. The triad was first officially named in 1993.

FEMALE STERILIZATION. The process of permanently ending a woman's ability to conceive by tying off or cutting apart the fallopian tubes.

FEMORAL ARTERY. An artery located in the groin area that is the most frequently accessed site for arterial puncture in angiography.

FEMUR. The thighbone.

FERRITIN. A protein found in the liver, spleen, and bone marrow that stores iron.

FERTILIZATION. The joining of the sperm and the egg; conception.

FETAL. Refers to the fetus, also known in the first two months after conception as an embryo.

FETAL ALCOHOL SYNDROME. A cluster of birth defects that includes abnormal facial features and mental retardation, caused by the mother's consumption of alcoholic beverages during pregnancy.

FETAL TISSUE TRANSPLANTATION. A method of treating Parkinson's and other neurological diseases by grafting brain cells from human fetuses onto the affected area of the human brain. Human adults cannot grow new brain cells but developing fetuses can. Grafting fetal tissue stimulates the growth of new brain cells in affected adult brains.

FETISHISM. Obtaining sexual arousal using or thinking about an inanimate object or part of the body.

FETOSCOPE. A fiber-optic instrument for viewing the fetus inside the uterus.

FETUS. A baby developing in the uterus from the third month to birth.

FIBER. Also known as roughage or bulk. Insoluble fiber moves through the digestive system almost undigested and gives bulk to stools. Soluble fiber dissolves in water and helps keep stools soft.

FIBEROPTICS. In medicine, fiberoptics uses glass or plastic fibers to transmit light through a specially designed tube. The tube is inserted into organs or body cavities where it transmits a magnified image of the internal body structures.

FIBRILLATION. Rapid, uncoordinated contractions of the upper or the lower chambers of the heart.

FIBRILLIN. A protein that is an important part of the structure of the body's connective tissue. In Marfan's syndrome, the gene responsible for fibrillin has mutated, causing the body to produce a defective protein.

FIBRIN. The protein formed as the end product of the blood clotting process when fibrinogen interacts with thrombin.

(c) 2011 Cengage Learning. All Rights Reserved.

FIBRIN SPLIT PRODUCTS (FSP). Pieces of the protein fibrin released from a dissolving clot.

FIBRINOGEN. A type of blood protein called a globulin that interacts with thrombin to form fibrin.

FIBRINOLYSIS. The clot dissolving portion of the coagulation process.

FIBROADENOMA. A benign breast growth made up of fibrous tissue.

FIBROBLAST. A connective-tissue cell.

FIBROID TUMOR. A noncancerous tumor formed of fibrous tissue.

FIBROIDS. Benign (noncancerous) growths that arise from the smooth muscle layer and connective tissue of the uterus. They sometimes cause secondary dysmenorrhea.

FIBROMA. A usually benign tumor consisting of fiborous tissue.

FIBROMUSCULAR DYSPLASIA. A disorder that causes unexplained narrowing of arteries and high blood pressure.

FIBROMYALGIA. A chronic disease syndrome characterized by fatigue, widespread muscular soreness, and pain at specific points on the body.

FIBROSIS. A condition characterized by the presence of scar tissue, or reticulin and collagen proliferation in tissues to the extent that it replaces normal tissues.

FIBROUS CONNECTIVE TISSUE. Dense tissue found in various parts of the body containing very few living cells.

FIFTH DISEASE. Erythema infectiosum; a common respiratory infection among children caused by parvovirus B19 that usually is not serious but can cause fetal complications.

FILARIAL. Threadlike. The word "filament" is formed from the same root word.

FILARIASIS. A tropical disease caused by worms that live in lymph channels.

FILARIFORM. Threadlike in appearance, like the infectious stage of the threadworm larva.

FILLING. Dental material that occupies the space remaining within a tooth after the decayed portion has been removed.

FILTRATE. The medical term for the water and small molecules filtered in the nephron of the kidney.

FINE NEEDLE ASPIRATION BIOPSY. A procedure using a thin needle to remove fluid and cells from a lump in the breast.

FINGER STICK. A technique for collecting a very small amount of blood from the fingertip area.

FIRST–RANK SYMPTOMS. A set of symptoms designated by Kurt Schneider in 1959 as the most important diagnostic indicators of schizophrenia. These symptoms include delusions, hallucinations, thought insertion or removal, and thought broadcasting. First–rank symptoms are sometimes referred to as Schneiderian symptoms.

FISSURE. Any cleft or groove, normal or otherwise, especially a deep fold in the anus.

FISTULA. A passageway formed by a disease or injury that drains fluid from an infected area to the outside or to other parts of the body.

FLACCID. Flabby, limp, weak.

FLACCID PARALYSIS. Paralysis characterized by limp, unresponsive muscles.

FLAGELLATE. A microorganism that uses flagella (hair-like projections) to move.

FLAGELLUM. A tail–like projection extending from the cell walls of certain bacteria. Its name is the Latin word for "whip."

FLAP. A section of tissue moved from one area of the body to another.

FLARE AND CELL. A pattern revealed by slit-lamp examination that indicates uveitis. Flare and cell resembles light filtered through smoke.

FLASHBACK. A temporary reliving of a traumatic event.

FLATULENCE. Excess gas in the digestive tract.

FLATUS. Gas or air in the digestive tract.

FLAVIVIRUS. An arbovirus that can cause potentially serious diseases, such as dengue, yellow fever, Japanese encaphilitis, and West Nile fever.

FLAVONOID. A food chemical that helps to limit oxidative damage to the body's cells, and protects against heart disease and cancer.

FLOATERS. Translucent specks that float across the visual field, due to small objects floating in the vitreous humor.

FLORA. Living inhabitants of a region or area.

(c) 2011 Cengage Learning. All Rights Reserved.

FLUENCY. The ability to produce a flow of words and not get "stuck," as in stuttering.

FLUKE. A parasitic flatworm that has external suckers. Flukes are sometimes called trematodes.

FLUORESCEIN. A fluorescent chemical used to examine the cornea.

FLUORESCEIN DYE. An orange dye used to illuminate the blood vessels of the retina in fluorescein angiography.

FLUORESCENCE IN SITU HYBRIDIZATION (FISH). A technique used to detect small deletions or rearrangements in chromosomes.

FLUORESCENT ANTIBODY TEST (FA TEST). A test in which a fluorescent dye is linked to an antibody for diagnostic purposes.

FLUORIDE. A chemical compound containing fluorine that is used to treat water or applied directly to teeth to prevent decay.

FLUOROQUINOLONES. A relatively new group of antibiotics that have had good success in treating infections with many gram-negative bacteria, such as *Shigella*; they should not be used in children under 17 years of age, because of possible effect on bone or cartilage growth.

FLUOROSCOPE. A device used in some radiology procedures that provides immediate images and motion on a screen much like those seen at airport baggage security stations.

FLUOROURACIL. A cell-killing (cytotoxic) medication that can be applied in cream form to treat cancer of the penis.

FLUOXETINE. The first SSRI; marketed as Sarafem for treating PMDD.

FLUVOXAMINE. An SSRI that is used to treat obsessive-compulsive disorder as well as other conditions.

FMR-1 GENE. A gene found on the X chromosome. Its exact purpose is unknown, but it is suspected that the gene plays a role in brain development.

FOLEY CATHETER. A tube that drains urine from the bladder.

FOLIC ACID. One of the B vitamins important for healthy growth of the fetus. It is essential to the normal development of a baby's spine, brain and skull, especially during the first four weeks of pregnancy.

FOLLICLE. The small sac at the base of a hair shaft. The follicle lies below the skin surface.

FOLLICLE STIMULATING HORMONE (FSH). A female hormone that regulates ovulation and menstruation.

FOLLICULAR. Relating to one of the round cells in the ovary that contain an ovum.

FOMITE. An inanimate object that can transmit infectious organisms.

FONTANEL. One of the membranous intervals between the uncompleted angles of the parietal and neighboring bones of a fetal or young skull; so called because it exhibits a rhythmical pulsation.

FOOD IRRADIATION METHODS. A process using radiant energy to kill microorganisms in food, to extend the amount of time in which food can be sold and eaten safely.

FOOD-BORNE ILLNESS. A disease that is transmitted by eating or handling contaminated food.

FOOTLING BREECH. A position of the fetus while in the uterus where the feet of the fetus are nearest the cervix and will be the first part of the fetus to exit the uterus, with the head of the fetus being the last part to exit the uterus.

FORAMEN (PLURAL, FORAMINA). The medical term for a natural opening or passage. The foramina of the spinal column are openings between the vertebrae for the spinal nerves to branch off from the spinal cord.

FORAMEN MAGNUM. The opening at the base of the skull, through which the spinal cord and the brainstem pass.

FORCED EXPIRATORY VOLUME (FEV). The volume of air exhaled from the beginning of expiration to a set time (usually 0.5, 1, 2, and 3 seconds).

FORCED VITAL CAPACITY (FVC). The volume of air that can be exhaled forceably after a maximal inspiration.

FOREMILK. Thin watery milk found at the beginning of breast feeding.

FORENSIC. Pertaining to or used during legal proceedings.

FORESKIN. A covering fold of skin over the tip of the penis.

FOVEA. A small area of the retina responsible for acute vision.

FRACTIONATION. A laboratory test or process in which blood or another fluid is broken down into its components. Fractionation can be used to assess the proportions of the different types of cholesterol in a

(c) 2011 Cengage Learning. All Rights Reserved.

blood sample. In radiation therapy, it is used to divide a dose of radiation into smaller treatment doses.

FRACTURE. A break in a bone.

FRAGILE X SYNDROME. A genetic condition related to the X chromosome that affects mental, physical, and sensory development.

FREE FLAP. A section of tissue detached from its blood supply, moved to another part of the body, and reattached by microsurgery to a new blood supply.

FREE RADICAL. An unstable molecule that causes oxidative damage by stealing electrons from surrounding molecules, thereby disrupting activity in the body's cells.

FREQUENCY. Sound, whether traveling through air or the human body, produces vibrations—molecules bouncing into each other—as the shock wave travels along. The frequency of a sound is the number of vibrations per second. Within the audible range, frequency means pitch—the higher the frequency, the higher a sound's pitch.

FRONTAL CORTEX. The part of the human brain associated with aggressiveness and impulse control. Abnormalities in the frontal cortex are associated with an increased risk of suicide.

FRONTAL LOBE. The largest, most forward-facing part of each side or hemisphere of the brain.

FROTTEURISM. Obtaining sexual arousal and gratification by rubbing one's genitals against others in public places.

FROZEN SHOULDER. A shoulder that becomes scarred and cannot move.

FRUCTOSE. A monosaccharide sugar found in many fruits.

FUCHS' DYSTROPHY. A hereditary disease of the inner layer of the cornea. Treatment requires penetrating keratoplasty. The lens of the eye may also be affected and require surgical replacement at the same time as the cornea.

FUGUE. A dissociative experience during which a person travels away from home, has amnesia for their past, and may be confused about their identity but otherwise appear normal.

FULMINANT. Occurring or flaring up suddenly and with great severity. A potentially fatal complication of amebic dysentery is an inflammation of the colon known as fulminant colitis.

FULMINATING COLITIS. A potentially fatal complication of amebic dysentery marked by sudden and severe inflammation of the intestinal lining, severe bleeding or hemorrhaging, and massive shedding of dead tissue.

FUNCTIONAL CYST. A benign cyst that forms on the ovary and resolves on its own without treatment.

FUNCTIONAL PAIN. Pain that does not have a structural or organic cause.

FUNCTIONAL RESIDUAL CAPACITY (FRC). The volume of air left in the lungs at the end of passive expiration (breathing out). It can be measured by body plethysmography.

FUNDOPLICATION. A surgical procedure that increases pressure on the LES by stretching and wrapping the upper part of the stomach around the sphincter.

FUNDUS. The inside of an organ. In the eye, refers to the back area that can be seen with the ophthalmoscope.

FUNGI. A kingdom of saprophytic and parasitic spore–producing organisms that include mushrooms and yeast.

FUNGUS. A member of a group of simple organisms that are related to yeast and molds.

FUNNEL BREAST. A condition where there is a hollow depression in the lower part of the chest.

FURUNCULOSIS. A condition in which the patient suffers from recurrent episodes of boils.

G

GADOLINIUM. A very rare metallic element useful for its sensitivity to electromagnetic resonance, among other things. Traces of it can be injected into the body to enhance the MRI pictures.

GAG REFLEX. A normal reflex consisting of elevation of the palate, retraction of the tongue, and contraction of the throat muscles.

GALACTORRHEA. Excessive or spontaneous flow of milk.

GALACTOSE. One of two simple sugars, the other being glucose, that make up the protein lactose found in milk. Galactose can be toxic in high levels.

GALACTOSEMIA. A rare genetic disorder where an infant cannot metabolize the sugar in breast milk, and therefore cannot breastfeed

GALLBLADDER. A small, pear-shaped organ in the upper right-hand corner of the abdomen. It is

(c) 2011 Cengage Learning. All Rights Reserved.

connected by a series of ducts (tube-like channels) to the liver, pancreas, and duodenum (first part of the small intestine). The gallbladder receives bile from the liver and concentrates and stores it. After a meal, bile is squeezed out of the gallbladder into the intestine, where it aids in digestion of food.

GALLIUM. A form of radionuclide that is used to help locate tumors and inflammation (specifically referred to as GA67 citrate).

GALLOP RHYTHM. An abnormal heart rhythm in which the doctor can hear three (sometimes four) sounds instead of the usual two, resembling the rhythm of a horse's gallop.

GALLSTONE ILEUS. Obstruction of the large intestine caused by a gallstone that has blocked the intestinal opening.

GAMETE. An egg (ovum) from the female or a mature sperm from the male.

GAMETE INTRAFALLOPIAN TUBE TRANSFER (GIFT). A reproductive procedure in which eggs are taken from a woman's ovaries, mixed with sperm, and then deposited into the woman's fallopian tube.

GAMMA CAMERA. A device inside the SPECT machine that forms images of the gamma rays emitted by the radionuclides used in tracers in nuclear medicine.

GAMMA GLOBULIN. One of a group of proteins found in the blood that is involved in helping the body fight infections.

GAMMA KNIFE. High-dose radiation treatment for intracranial tumors.

GAMMA RAYS. Short wavelength, high energy electromagnetic radiation emitted by radioactive substances.

GANGLION. A mass of nerve tissue outside of the central nervous system.

GANGLIONEUROMA. A ganglioneuroma is a tumor composed of mature nerve cells.

GANGLIOSIDE. A fatty (lipid) substance found within the brain and nerve cells.

GANGRENE. Death of tissue due to loss of blood supply followed by bacterial invasion and putrefaction.

GANSER'S SYNDROME. An unusual factitious disorder characterized by dissociative symptoms and absurd answers to direct questions.

GANTRY. A name for the couch or table used in a CT scan. The patient lies on the gantry while it slides into the x-ray scanner portion.

GAS EMBOLISM. The presence of gas bubbles in the bloodstream that obstruct circulation. Also called air embolism.

GAS EXCHANGE. The process by which oxygen is extracted from inhaled air into the bloodstream, and, at the same time, carbon dioxide is eliminated from the blood and exhaled.

GASTRIC. Relating to the stomach.

GASTRIC LAVAGE. Also called a stomach pump. For this procedure, a flexible tube is inserted through the nose, down the throat, and into the stomach and the contents of the stomach are suctioned out. The inside of the stomach is rinsed with a saline (salt water) solution.

GASTRIC (OR PEPTIC) ULCER. An ulcer (sore) of the stomach, duodenum or other part of the gastrointestinal system. Though the causes are not fully understood, they include excessive secretion of gastric acid, stress, heredity, and the use of certain drugs, especially acetylsalicylic acid and nonsteroidal anti-inflammatory-drugs.

GASTRIN. A hormone secreted in the stomach that is involved in the production of gastric acid. Overproduction of gastric acid contributes to peptic ulcer formation.

GASTRINOMA. Tumor that arises from the gastrin-producing cells in the pancreas.

GASTROENTERITIS. An inflammation of the lining of the stomach and intestines, usually caused by a viral or bacterial infection.

GASTROENTEROLOGIST. A doctor who specializes in diagnosing and treating diseases of the digestive system.

GASTROESOPHAGEAL REFLUX DISEASE (GERD). A condition in which gastric juice from the stomach backs up into the bottom of the esophagus and causes irritation, inflammation, or erosion of the cells lining the esophagus.

GASTROINTESTINAL. Pertaining to the stomach and intestines.

GASTROINTESTINAL TRACT. A group of organs and related structures that includes the esophagus, stomach, liver, gallbladder, pancreas, small intestine, large intestine, rectum, and anus.

(c) 2011 Cengage Learning. All Rights Reserved.

GASTROJEJUNOSTOMY. A surgical procedure in which the stomach is surgically connected to the jejunum (middle portion of the small intestine).

GASTROPLASTY. A surgical procedure used to reduce digestive capacity by shortening the small intestine or shrinking the side of the stomach.

GASTROSCOPY. Looking into the stomach with a flexible viewing instrument called a gastroscope.

GASTROSTOMY. Surgical creation of an artificial opening into the stomach through the abdominal wall to allow tube feeding.

GASTROSTOMY TUBE. Stomach tube for feeding.

GAUCHER'S DISEASE. A rare genetic disease caused by a deficiency of enzymes needed for the processing of fatty acids.

GELASTIC SEIZURES. Seizures manifesting with brief involuntary laughter.

GENDER IDENTITY DISORDER (GID). A condition in which a person strongly identifies with the opposite gender and feels uncomfortable with his or her biological sex. It occurs more often in males than in females.

GENDER REASSIGNMENT SURGERY. The surgical alteration and reconstruction of a person's sex organs to resemble those of the other sex as closely as possible. It is sometimes called gender reassignment surgery.

GENE. The basic unit of genetic material carried in a particular place on a chromosome. Genes are passed on from parents to child during conception and determine how traits such as blood type are inherited and expressed.

GENE THERAPY. A method of treating a disorder by replacing damaged or abnormal genes with normal ones.

GENERAL ANESTHESIA. Deep sleep induced by a combination of medicines that allows surgery to be performed.

GENERAL PARESIS. An advanced form of neurosyphilis affecting personality and control of movement and possibly causing convulsions or partial paralysis.

GENERAL SURGEON. A physician who has special training and expertise in performing a variety of operations.

GENETIC CLUSTER. A group of viral strains with very similar, yet distinct, nucleic acid sequences.

GENETIC DISEASE. A disease that is (partly or completely) the result of the abnormal function or expression of a gene; the inheritance and expression of a genetic mutation.

GENIOPLASTY. An operation performed to reshape the chin. Genioplasties are often done to treat OSA because the procedure changes the structure of the patient's upper airway.

GENITAL. Sexual organ.

GENITAL HERPES. A sexually-transmitted disease caused by the herpes simplex virus.

GENOGRAM. A family tree diagram that represents the names, birth order, sex, and relationships of the members of a family. Therapists use genograms to detect recurrent patterns in the family history and to help the members understand their problem(s).

GENOGROUP. Related viruses within a genus; may be further subdivided into genetic clusters.

GENOME. The genetic makeup of a cell, composed of DNA.

GENOTYPE. The genetic makeup of a cell or organism.

GENU VALGUM. Deformity in which the legs are curved inward so that the knees are close together, nearly or actually knocking as a person walks with ankles widely apart of each other.

GENUINE URINARY STRESS INCONTINENCE (USI). Stress incontinence due to hypermobility of the urethra.

GEOPHAGIA. The compulsive eating of earthy substances, including sand, soil, and clay.

GERM. A disease-causing microorganism.

GERM CELL. One of the cells that ordinarily develops into eggs or sperm (also sperm and eggs).

GERMINOMA. A tumor of germ cells (ovum and sperm cells that participate in production of the developing embryo).

GESTALT THERAPY. A humanistic therapy technique that focuses on gaining an awareness of emotions and behaviors in the present rather than in the past.

GESTATION. The period from conception to birth, during which the developing fetus is carried in the uterus.

GESTATIONAL AGE. The estimated age of a fetus expressed in weeks, calculated from the first day of the last normal menstrual period.

GESTATIONAL TROPHOBLASTIC DISEASE. A rare, aggressive, malignant, often metastatic (spreading to other organs) cancer in women of childbearing age in

(c) 2011 Cengage Learning. All Rights Reserved.

which cancer cells grow in the tissues that are formed in the uterus after conception.

GHRELIN. A peptide hormone secreted primarily by the stomach that has been implicated in the control of food intake and fat storage.

GIANT CELL ARTERITIS. Also called temporal arteritis. A condition which causes the inflammation of temporal arteries. It can cause blindness when the inflammation effects the ophthalmic artery.

GIARDIA LAMBLIA. A type of protozoa with a whip-like tail that infects the human intestinal tract, causing giardiasis. The protozoa will not spread to other parts of the body.

GIARDIASIS. A condition in which the intestines are infected with *Giardia lamblia*, a type of protozoan.

GIGANTISM. Excessive growth, especially in height, resulting from overproduction during childhood or adolescence of growth hormone by a pituitary tumor. Untreated, the tumor eventually destroys the pituitary gland, resulting in death during early adulthood. If the tumor develops after growth has stopped, the result is acromegaly, not gigantism.

GILBERT'S SYNDROME. A mild hereditary form of jaundice.

GILLBERG'S CRITERIA. A six–item checklist for Asperger syndrome developed by Christopher Gillberg, a Swedish researcher. It is widely used as a diagnostic tool.

GINGIVITIS. Inflammation of the gums, seen as painless bleeding during brushing and flossing.

GINKGO. An herb from *Ginkgo biloba*, a shade tree native to China with fan-shaped leaves and fleshy seeds with edible kernels.

GLAND. A collection of cells that releases certain chemicals, or hormones, that are important to the functioning of other organs or body systems.

GLANS. The head of the penis.

GLAUCOMA. A condition in which pressure in the eye is abnormally high, damaging the optic nerve. If not treated, glaucoma may lead to blindness.

GLEASON GRADING SYSTEM. A method of predicting the tendency of a tumor in the prostate to metastasize based on how similar the tumor is to normal prostate tissue.

GLOBAL APHASIA. A condition characterized by either partial or total loss of the ability to communicate verbally or using written words as a result of widespread injury to the language areas of the brain. This condition may be caused by a stroke, head injury, brain tumor, or infection.

GLOBIN. Protein component of hemoglobin. Normal adult hemoglobin has a pair each of alpha-globin and beta-globin molecules that each contain a heme group.

GLOBULINS. A group of proteins in blood plasma whose levels can be measured by electrophoresis in order to diagnose or monitor a variety of serious illnesses.

GLOMERULAR KIDNEY DISEASE. Disease of the kidney that affects the glomeruli, the part of the kidney that filters certain substances out of the blood.

GLOMERULI (SINGULAR, GLOMERULUS). Groups of tiny blood vessels with very thin walls that function as filters in the kidney.

GLOMERULONEPHRITIS. An inflammation of the filtering units of the kidney (glomeruli). The condition impairs the kidney's ability to filter waste products, salt, and water from the bloodstream, leading to serious complications such as renal failure.

GLOSSOPHARYNGEAL NEURALGIA. Sharp recurrent pain deep in the throat that extends to the area around the tonsils and possibly the ear. It is triggered by swallowing or chewing.

GLOTTIS. The opening between the vocal cords at the upper part of the larynx.

GLUCOCEREBROSIDE. A cerebroside that contains glucose in the molecule.

GLUCOCORTICOID THERAPY. Treatment using corticoids that are anti-inflammatory and immunosuppressive.

GLUCOCORTICOIDS. A class of steroid hormones synthesized by the adrenal cortex that are involved in fat, protein, and carbohydrate metabolism and that have anti-inflammatory and immunosuppressive actions; also known as glucocorticosteroids.

GLUCOSE. A simple sugar produced when carbohydrates are broken down in the small intestine. It is the primary source of energy for the body.

GLUCOSE-6-PHOSPHATE DEHYDROGENASE (G6PD) DEFICIENCY. An inherited disorder in which the body lacks an enzyme that normally protects red blood cells from toxic chemicals. When people with this condition take certain drugs, or sometimes when they have a fever or an infection, their red blood cells break down, causing anemia.

(c) 2011 Cengage Learning. All Rights Reserved.

GLUTATHIONE. A molecule that acts as a co-enzyme in cellular oxidation-reduction reactions.

GLUTEN. A protein found in wheat, rye, barley, and oats.

GLUTEN ENTEROPATHY. A hereditary malabsorption disorder caused by sensitivity to gluten, a protein found in wheat, rye, barley, and oats. Also called nontropical sprue or Celiac disease.

GLYCEMIC INDEX (GI). A ranking from 1–100 that measures how much carbohydrate-containing foods raise blood sugar levels within two hours after being eaten. Foods with a glycemic index of 50 or lower are considered "good" because they are digested at a slower rate.

GLYCOGEN. A macromolecule composed mainly of glucose that serves as the storage form of glucose that is not immediately needed by the body.

GLYCOGENOLYSIS. The process of tearing-down a glycogen molecule to free up glucose.

GLYCOGENOSIS. An alternate term for glycogen storage disease. The plural form is glycogenoses.

GLYCOLYSIS. The pathway in which a cell breaks down glucose into energy.

GLYCOSYLATED HEMOGLOBIN. A test that measures the amount of hemoglobin bound to glucose. It is a measure of how much glucose has been in the blood during the past two to four months.

GNRH ANTAGONISTS. A group of medications that affect the reproductive hormones. These medications are used to treat fibroids, endometriosis, and infertility.

GOECKERMAN REGIMEN. UVB light therapy combined with topical coal-tar preparations.

GOITER. An abnormal enlargement of the thryroid gland.

GONADOTROPINS. Protein hormones secreted by the pituitary gland that affect and stimulate the ovaries or testes; used in treating infertility.

GONADS. Glands that make sex hormones and reproductive cells—testes in the male, ovaries in the female.

GONIOMETER. An instrument for measuring angles of a joint.

GONIOSCOPE. An instrument used to inspect the eye. It consists of a magnifier and a lens equipped with mirrors and is placed on the patient's cornea.

GONOCOCCUS (PLURAL, GONOCOCCI). The bacterium *Neisseria gonorrheae* that causes gonorrhea, a sexually transmitted infection of the genitals and urinary tract. Gonococci may occasionally affect the eye, causing blindness if not treated.

GONORRHEA. A sexually transmitted disease that affects the genital mucous membranes of men and women.

GONZALEZ REGIMEN. An alternative therapy for pancreatic cancer that includes a special diet, nutritional supplements, pancreatic enzymes, and coffee enemas.

GOUT. A type of arthritis in which uric acid, a waste product that normally passes out of the body in urine, collects in the joints and the kidneys, resulting in swollen, painful joints and possibly kidney stones.

GRAFT. A transplanted organ or other tissue.

GRAFT VERSUS HOST DISEASE. A life-threatening complication of bone marrow transplants in which the donated marrow causes an immune reaction against the recipient's body.

GRAINS. Flecks of hardened material such as bacteria or fungi spores.

GRAM STAIN. A staining procedure used to visualize and classify bacteria. The Gram stain procedure allows the identification of purple (Gram positive) organisms and red (Gram negative) organisms.

GRANULATION TISSUE. A kind of tissue formed during wound healing, with a rough or irregular surface and a rich supply of blood capillaries.

GRANULE. A small grain or pellet. Medicines that come in granule form usually are mixed with liquids or sprinkled on food before they are taken.

GRANULOCYTE. Any of several types of white blood cells that have granules in their cell substance. Neutrophils are the most common type of granulocyte.

GRANULOCYTE/MACROPHAGE COLONY STIMULATING FACTOR (GM–CSF). Also known as sargramostim, a substance produced by cells of the immune system that stimulates an attack upon foreign cells. Used to treat prostate cancers as a genetically engineered component of a vaccine that stimulates the body to attack prostate tissue.

GRANULOCYTOPENIA. A condition characterized by a deficiency of white blood cells.

GRANULOMA. A nodule or mass of chronically inflamed tissue.

(c) 2011 Cengage Learning. All Rights Reserved.

GRANULOMATOUS. Resembling a tumor made of granular material.

GRANULOMATOUS DISEASE. Characterized by growth of tiny blood vessels and connective tissue.

GRANULOMATOUS MYOCARDITIS. Also called giant cell myocarditis, this noninfectious inflammation of the heart causes large areas of tissue death in the heart muscle, ventricular enlargement, and clots inside the heart chambers.

GRAVEL. The debris which is formed from a fragmented kidney stone.

GRAVES' DISEASE. An autoimmune disorder of the thyroid gland, in which the gland swells to twice its normal size and secretes too much thyroid hormone.

GRAY MATTER. The portion of the brain that contains neurons, as opposed to white matter, which contains nerve tracts.

GROIN. The region of the body that lies between the abdomen and the thighs.

GROUP A STREPTOCOCCUS. A sphere–shaped bacterium that grows in long chains and causes strep throat as well as scarlet fever and some forms of tonsillitis.

GROUP B STREPTOCOCCAL (GBS) DISEASE. A common bacterial infection that is potentially life-threatening if transmitted to a fetus during early pregnancy or birth.

GROUP THERAPY. Group interaction designed to provide support, correction through feedback, constructive criticism, and a forum for consultation and reference.

GROWTH FACTOR. A naturally occuring compound in the body that promotes cellular growth and survival.

GROWTH HORMONE. A hormone that eventually stimulates growth; also called somatotropin.

GROWTH PLATE. The place in long bones where growth occurs during childhood.

GUAIAC. A compound derived from the wood resin of guaiacum trees. Guaiac reacts with blood in the stool to produce a blue-colored reaction when peroxide is added to the sample.

GUIDE WIRE. A wire that is inserted into an artery to guide a catheter to a certain location in the body.

GUIDED IMAGERY. The use of relaxation and mental visualization to improve mood and/or physical well-being.

GUILLAIN-BARRÉ SYNDROME. A disorder in which the body's immune system attacks part of the peripheral nervous system, destroying the myelin sheath that surrounds the nerves. The syndrome usually occurs after a respiratory infection and results in progressive but reversible paralysis or weakness of multiple muscles, starting in the lower extremities and often ascending to the muscles involved in respiration.

GUMMA. A rubbery swelling or tumor that heals slowly and leaves a scar and is a symptom of tertiary syphilis.

GUTTA PERCHA. An inert, latex-like substance used for filling root canals.

GYNECOLOGIST. A physician with specialized training in diseases and conditions of the female reproductive system.

GYNECOMASTIA. Excessive growth of breast tissue in males.

H

H1N1 (SWINE FLU). A virus that was originally found in pigs, symptoms of H1N1 influenza include fever, cough, chills, fatigue, headache, and body aches.

H2 BLOCKERS. Also known as H_2 antagonists, a type of drug that relieves indigestion by reducing the production of stomach acid.

HAIR CELLS. Sensory receptors in the inner ear that transform sound vibrations into messages that travel to the brain.

HAIR FOLLICLE. A tube-like indentation in the skin from which a single hair grows.

HAIRBULB. The root of a strand of hair from which the color develops.

HALF-LIFE. The time required for half of the atoms in a radioactive substance to disintegrate.

HALITOSIS. The medical term for bad breath.

HALLUCINATION. A false or distorted sensory experience that appears to be real to the person experiencing it.

HALLUCINOGEN. A drug that distorts sensory perceptions and disturbs emotion, judgment, and memory.

(c) 2011 Cengage Learning. All Rights Reserved.

HALLUCINOGEN PERSISTING PERCEPTION DISORDER (HPPD). The recurrence of LSD effects after the drug experience has ended.

HANTAVIRUS. A group of arboviruses that cause hemorrhagic fever (characterized by sudden onset, fever, aching and bleeding in the internal organs).

HAPTOGLOBIN. A protein in blood plasma that binds hemoglobin.

HARVESTING. The process of removing tissues or organs from a donor and preserving them for transplantation.

HASHIMOTO'S DISEASE. An autoimmune disorder that is the most common cause of primary hypothyroidism. It was the first disease to be recognized as an autoimmune disorder. It is named for a Japanese doctor, Hakaru Hashimoto, who first described it in 1912.

HATHA YOGA. Form of yoga using postures, breathing methods and meditation.

HDL CHOLESTEROL. High-density lipoprotein cholesterol; a component of cholesterol that helps protect against heart disease. HDL is nicknamed "good" cholesterol.

HEART ATTACK. A cardiac emergency that occurs when a clot blocks blood flow in one or more of the heart's arteries. Oxygen supply to the heart muscle is cut off, resulting in the death of heart tissue in the affected area.

HEART BLOCK. A problem with electrical conduction in the heart muscle that may lead to irregular heart beat and require a pacemaker for treatment.

HEART CATHETERIZATION. A heart catheterization is used to view the heart's chamber and valves. A tube (catheter) is inserted into an artery, usually in the groin. A dye is then put into the artery through the tube. The dye makes its way to the heart to create an image of the heart on x-ray film. The image is photographed and stored for further examination.

HEART FAILURE. A term used when the heart is unable to pump enough blood to supply the needs of the body.

HEART MURMUR. Sound during the heartbeat caused by a heart valve that does not close properly.

HEART VALVES. Valves that regulate blood flow into and out of the heart chambers.

HEARTBURN. A burning sensation in the chest that can extend to the neck, throat, and face, caused by the movement of stomach acid flowing backwards (refluxing) into the esophagus.

HEAT STROKE. A severe condition caused by prolonged exposure to high heat. Heat stroke impedes the body's ability to cool itself and can lead to collapse and coma.

HEAVY METAL. One of 23 chemical elements that has a specific gravity (a measure of density) at least five times that of water.

HEIMLICH MANEUVER. The application of sudden upward pressure on the upper abdomen to force an obstructing object from the trachea of a choking victim.

HELICOBACTER PYLORI. A gram-negative rod-shaped bacterium that lives in the tissues of the stomach and causes inflammation of the stomach lining.

HELMINTHS. Parasitic worms, such as tapeworms or liver flukes, that can live in the human body.

HEMAGGLUTINATION. The clumping or clustering of red blood cells caused by certain viruses, antibodies, or other substances.

HEMARTHROSIS. A condition of blood within a joint.

HEMATIN. A drug administered intravenously to halt an acute porphyria attack. It causes heme biosynthesis to decrease, preventing the further accumulation of heme precursors.

HEMATOCRIT. The proportion of whole blood in the body, by volume, that is composed of red blood cells.

HEMATOCRIT (HCT) LEVEL. A measure of red blood cells.

HEMATOLOGIST. A physician who specializes in diseases of the blood and blood-forming organs.

HEMATOLOGY. The medical specialty that deals with the blood and the organs that form blood.

HEMATOMA. An accumulation of blood, often clotted, in a body tissue or organ, usually caused by a break or tear in a blood vessel.

HEMATOPOIETIC CELLS. Those cells that are lodged within the bone marrow and are responsible for producing the cells that circulate in the blood (red blood cells, white blood cells, and platelets).

HEMATOPOIETIC STEM CELL. A cell that can develop into any type of specialized blood cell.

(c) 2011 Cengage Learning. All Rights Reserved.

HEMATOPOIETIC SYSTEM. The system in the body responsible for the production of blood cells.

HEMATOPORPHYRIN. A dark reddish-purple pigment found in blood. A purified form of hematoporphyrin is used to make porfimer sodium.

HEMATURIA. Blood in the urine.

HEME. The iron-containing molecule in hemoglobin that serves as the site for oxygen binding.

HEMIPLEGIA. Paralysis of one side of the body.

HEMISPHERE. One of the two halves or sides—the left and the right—of the brain.

HEMIVERTEBRA. Condition in which one side of a vertebra fails to form normally before birth.

HEMOCHROMATOSIS. A disorder of iron metabolism characterized by excessive absorption of iron from food.

HEMOCYTOMETER. An instrument used to count platelets or other blood cells.

HEMODIALYSIS. The removal of waste products from the blood stream in patients with kidney failure. Blood is removed from a vein, passed through a dialysis machine, and then put back into a vein.

HEMODILUTION. A technique in which the fluid content of the blood is increased without increasing the number of red blood cells.

HEMOGLOBIN. A protein-iron compound in red blood cells that functions primarily in carrying oxygen from the lungs to the tissues of the body.

HEMOGLOBIN A. Normal adult hemoglobin that contains four heme molecules, two alpha-globin molecules, and two beta-globin molecules.

HEMOGLOBIN C DISEASE. A disease of abnormal hemoglobin, occurring in 2–3% of African Americans. Only those who have two genes for the disease develop anemia, which varies in severity. Symptoms include episodes of abdominal and joint pain, an enlarged spleen and mild jaundice.

HEMOGLOBIN ELECTROPHORESIS. A laboratory test that separates molecules based on their size, shape, or electrical charge.

HEMOGLOBIN H DISEASE. A thalassemia-like syndrome causing moderate anemia and red blood cell abnormalities.

HEMOLYSIS. The destruction or breakdown of red blood cells, resulting in the release of hemoglobin.

HEMOLYTIC. Able to break down or dissolve red blood cells.

HEMOLYTIC ANEMIA. A type of anemia marked by the premature breakdown of red blood cells.

HEMOLYTIC BACTERIA. Bacteria that are able to burst red blood cells.

HEMOLYTIC-UREMIC SYNDROME (HUS). A potentially fatal complication of *E. coli* infections characterized by kidney failure and destruction of red blood cells.

HEMOPHILIA. An inherited bleeding disorder caused by a deficiency of factor VIII, one of a series of blood proteins essential for blood clotting.

HEMOPTYSIS. The coughing up of large amounts of blood or of blood-containing sputum.

HEMORRHAGE. Abnormal and excessive bleeding.

HEMORRHAGIC. A condition resulting in massive, difficult-to-control bleeding.

HEMORRHOID. An area around the anus comprised of enlarged veins and swollen tissue, causing itching and pain.

HEMOSIDEROSIS. An overload of iron in the body resulting from repeated blood transfusions. Hemosiderosis occurs most often in patients with thalassemia.

HEMOTHORAX. Blood in the pleural cavity.

HENNA. Mehndi; a reddish-brown dye from the leaves of the henna plant; used for hair dye and temporary tattoos.

HEPARIN. A blood component that controls the amount of clotting. It can be used as a drug to reduce blood clot formation.

HEPARIN CHALLENGE TEST. A medical test to evaluate how readily the blood clots.

HEPATIC. Referring to the liver.

HEPATIC ARTERY. The blood vessel supplying arterial blood to the liver.

HEPATITIS. Inflammation of the liver caused by a virus, chemical, or drug.

HEPATITIS B. A disease that causes inflammation of the liver and serious liver damage.

HEPATOBILIARY SCAN. Another term for a gallbladder nuclear medicine scan.

HEPATOCELLULAR. Of or pertaining to liver cells.

HEPATOCYTE. A liver cell.

(c) 2011 Cengage Learning. All Rights Reserved.

HEPATOMEGALY. General swelling of the liver.

HEPATOTOXIN. A substance that is toxic to the liver.

HEREDITARY. Something that is inherited or passed down from parents to offspring. In biology and medicine, the word pertains to inherited genetic characteristics.

HEREDITARY ANGIOEDEMA. A complement deficiency characterized by lymphatic vessel blockages that cause temporary swelling (edema) of areas of the skin, mucous membranes, and, sometimes, internal organs.

HEREDITARY ATAXIA. One of a group of hereditary degenerative diseases of the spinal cord or cerebellum. These diseases cause tremor, spasm, and wasting of muscle.

HEREDITARY SPHEROCYTOSIS (HS). A blood disorder in which the red blood cells are relatively fragile and are damaged or destroyed when they pass through the spleen. Splenectomy is the only treatment for HS.

HERMANSKY-PUDLAK SYNDROME (HPS). A rare type of albinism characterized by a problem with blood clotting and a buildup of waxy material in lungs and intestines.

HERNIA. A rupture in the wall of a body cavity, through which an organ may protrude.

HERNIATED DISK. A protrusion in a disk located in the spinal column.

HERNIORRHAPHY. Surgical repair of a hernia.

HERPES SIMPLEX VIRUS (HSV). A virus that causes sores on or in the mouth (cold sores, HSV type 1) or on the genitals (genital herpes, HSV type 2).

HERPES VIRUSES. A family of viruses including herpes simplex types 1 and 2, and herpes zoster (also called varicella zoster). Herpes viruses cause several infections, all characterized by blisters and ulcers, including chicken pox, shingles, genital herpes, and cold sores or fever blisters.

HERPES ZOSTER VIRUS. Acute inflammatory virus that attacks the nerve cells on the root of each spinal nerve with skin eruptions along a sensory nerve ending.

HETEROZYGOTE. An individual who has one gene in a pair that has a mutation while the other gene in the pair is unaffected.

HETEROZYGOUS. Two different genes controlling a specified inherited trait.

HIATAL HERNIA. A condition where part of the stomach protrudes through the diaphragm into the chest cavity; also called hiatus hernia.

HIB DISEASE. An infection caused by *Haemophilus influenza* type b (Hib). This disease mainly affects children under the age of five. In that age group, it is the leading cause of bacterial meningitis, pneumonia, joint and bone infections, and throat inflammations.

HIGH SPOT. An area of a tooth or restoration that feels abnormal or uncomfortable because it hits its opposing tooth before other teeth meet.

HIGH-DENSITY LIPOPROTEIN (HDL). A type of lipoprotein that protects against coronary artery disease by removing cholesterol deposits from arteries or preventing their formation.

HIGH-FUNCTIONING AUTISM (HFA). A subcategory of autistic disorder consisting of children diagnosed with IQs of 70 or higher.

HIGHLY ACTIVE ANTIRETROVIRAL THERAPY (HAART). An individualized combination of three or more antiretroviral drugs used to treat patients with HIV infection. It is sometimes called a drug cocktail.

HIGH-RISK HPV TYPE. A member of the HPV family of viruses that is associated with the development of cervical cancer and precancerous growths.

HIPPOCAMPUS. A part of the brain's limbic system that is involved in memory formation and learning.

HIRSCHSPRUNG DISEASE. Hirschsprung disease is a congenital abnormality (birth defect) of the bowel in which there is absence of the ganglia (nerves) in the wall of the bowel.

HIRSUTISM. Excessive hair growth on the face and body.

HISTAMINE. A chemical found naturally in the body that produces inflammation and increases blood flow; the uncomfortable symptoms of an allergy attack or an allergic reaction are generally caused by the release of histamine.

HISTOCOMPATIBILITY. The relationship between tissues that characterizes how well a patient and donor are matched in a transplant or graft.

HISTOCOMPATIBILITY ANTIGENS. Histocompatibility determinants; proteins scattered throughout body tissues that are unique for almost every individual.

HISTOLOGY. The study of the structure, composition, and function of tissues of organs.

(c) 2011 Cengage Learning. All Rights Reserved.

HISTOPATHOLOGY. The study of diseased tissues at a minute (microscopic) level.

HISTRIONIC. A behavior characterized by an excitable nature and the constant desire for stimulation.

HIVES. A raised, itchy area of skin that is usually a sign of an allergic reaction.

HLA-B27. An antigen or protein marker on cells that may indicate ankylosing spondylitis.

HODGKIN DISEASE. Cancer of the lymphatic system, characterized by lymph node enlargement.

HOLISTIC. In medicine, a practice that focuses on treating the patient as a whole (rather than just treating the disease); addresses the physical, social, emotional, and spiritual needs of a patient.

HOLTER MONITOR. A portable device used to record heart rhythms over a period of at least 24 hours.

HOME MODIFICATION. The altering of the physical environment of the home to remove hazards and provide a more functional environment; examples include the installation of grab bars and no-slip foot mats in the bathroom to prevent falls.

HOME PARENTERAL NUTRITION (HPN). Long-term parenteral nutrition, given through a central venous catheter and administered in the patient's home.

HOMEOPATHY. The use of diluted remedies that would otherwise produce symptoms similar to those they are curing. They are prescribed according to the axiom that "like cures like."

HOMEOSTASIS. The regulation of body processes to maintain an internal balance.

HOMOCYSTEINE. An amino acid normally found in small amounts in the blood.

HOMOZYGOTE. An individual who has both genes in a pair with the same mutation.

HOMOZYGOUS. A condition in which both genes in a pair have the same mutation.

HOOKWORM. Parasitic intestinal infestation caused by any of several parasitic nematode worms of the family Ancylostomatidae. These worms have strong buccal hooks that attach to the host's intestinal lining.

HORMONE. A chemical messenger produced by the body that is involved in regulating specific bodily functions such as growth, development, reproduction, metabolism, and mood.

HORMONE REPLACEMENT THERAPY (HRT). Short-term replacement of the hormones (estrogen and progesterone) that a woman's body no longer produces after menopause; may lower the risk of osteoporosis in postmenopausal women.

HORMONE THERAPY. Manipulation of hormone levels in the body for a medical purpose, such as to inhibit menstruation (contraception); in cancer treatment, focuses on inhibiting the production of certain hormones instead of using cell-killing drugs.

HOSPICE. A facility or program that provides for the physical and emotional needs of the terminally ill in a caring environment.

HOST. An organism that is infected by a virus, bacterium, or parasite.

HOT FLASH. A wave of heat that is one of the most common perimenopausal symptoms, triggered by the hypothalamus' response to estrogen withdrawal.

"HOT TUB" FOLLICULITIS. A skin infection caused by *P. aeruginosa* that often follows bathing in a hot tub or public swimming pool.

HUMAN CHORIONIC GONADOTROPIN (HCG). A hormone produced by the placenta during pregnancy.

HUMAN HERPESVIRUS 8. Also called Kaposi's sarcoma–associated herpesvirus (KSHV), this virus is thought to be a cause for Kaposi's sarcoma.

HUMAN IMMUNODEFICIENCY VIRUS (HIV). The virus that causes acquired immune deficiency syndrome (AIDS).

HUMAN LEUCKOCYTE ANTIGEN (HLA). A group of protein molecules located on bone marrow cells that can provoke an immune response. A donor's and a recipient's HLA types should match as closely as possible to prevent the recipient's immune system from attacking the donor's marrow as a foreign material that does not belong in the body.

HUMAN PAPILLOMAVIRUS (HPV). A group of viruses that cause abnormal cell growth (warts or papillomas) on the hands, feet, or genitals; some types can cause cervical cancer.

HUMAN POTENTIAL MOVEMENT. A movement in psychotherapy that began in the 1960s and emphasized maximizing the potential of each participant through such techniques as group therapy and sensitivity training.

HUMANIZATION. Fusing the constant and variable framework region of one or more human immunoglobulins with the binding region of an animal immunoglobulin, done to reduce human reaction against the fusion antibody.

(c) 2011 Cengage Learning. All Rights Reserved.

HUMERUS. The bone of the upper arm.

HUMORAL. Pertaining to or derived from a body fluid. The humoral part of the immune system includes antibodies and immunoglobulins in blood serum.

HUNTINGTON'S DISEASE. A hereditary disease that typically appears in midlife, characterized by progressive dementia and loss of control over voluntary movements. It is sometimes called Huntington's chorea.

HYALINE MEMBRANE. A fibrous layer that settles in the lungs and prevents oxygen from escaping to the bloodstream, resulting in increased carbon dioxide levels.

HYDATIDIFORM MOLE. Also called a molar pregnancy. A mass of abnormal, partially developed tissues inside the uterus (womb). Moles develop during a pregnancy that begins with an abnormal fertilization. The mass may or may not be cancerous.

HYDRATION. Taking in water or fluid to replace loss of fluid.

HYDROCELE. An accumulation of fluid in the membrane that surrounds the testis.

HYDROCEPHALUS. Abnormal accumulation of cerebrospinal fluid within the skull, causing expansion of the skull and brain.

HYDROCORTISONE. A steroid hormone produced by the adrenal glands that provides resistance to stress.

HYDROGEN. The simplest, most common element known in the universe. It is composed of a single electron (negatively charged particle) circling a nucleus consisting of a single proton (positively charged particle).

HYDROGEN PEROXIDE. A colorless, unstable compound of hydrogen and oxygen (H_2O_2). An aqueous solution of hydrogen peroxide is used as an antiseptic and bleaching agent.

HYDROPS FETALIS. A condition in which a fetus or newborn baby retains fluids, causing swollen arms and legs and impaired breathing.

HYDROTHERAPY. The use of water (hot, cold, steam, or ice) to relieve discomfort and promote physical well-being; also known as water therapy.

HYDROXYAPATITE. A calcium phosphate complex that is the primary mineral component of bone.

HYDROXYUREA. A drug that has been shown to induce production of fetal hemoglobin.

HYMEN. A membrane that partially or completely covers the vaginal opening.

HYMENOLEPIASIS. Parasitic infection caused by the presence of tapeworms from the *Hymenolepis* genus, such as the dwarf tapeworm (*Hymenolepis nana*) or the rodent tapeworm (*Hymenolepis diminuta*).

HYPERALIMENTATION. A method of re-feeding anorectics by infusing liquid nutrients and electrolytes directly into central veins through a catheter.

HYPERANDROGENISM. Excessive secretion of androgens (male sex hormones).

HYPERAROUSAL. A state of increased emotional tension and anxiety, often including jitteriness and being easily startled.

HYPERBARIC CHAMBER. A sealed compartment in which patients are exposed to controlled pressures of up to three times normal atmospheric pressure.

HYPERBARIC OXYGEN THERAPY (HBOT). A form of oxygen therapy in which the patient breathes pure oxygen in a pressurized chamber. Hyperbaric treatment may be used to regulate blood gases, reduce gas bubbles, and provide higher levels of oxygen more quickly.

HYPERBARIC OXYGENATION. Administration of oxygen in a compression chamber at an ambient pressure greater than one atmosphere, in order to increase the amount of oxygen in organs and tissues.

HYPERBILIRUBINEMIA . An excess of bilirubin in the blood.

HYPERCALCEMIA. Abnormally high levels of calcium in the blood.

HYPERCHOLESTEROLEMIA. The presence of excessively high levels of cholesterol in the blood.

HYPEREMESIS. Severe vomiting during pregnancy. Hyperemesis appears to increase a woman's risk of postpartum depression.

HYPEREXTENSIBILITY. The ability to extend a joint beyond the normal range.

HYPERGLYCEMIA. Too much glucose or sugar in the blood.

HYPERHIDROSIS. Excessive sweating. Hyperhidrosis can be caused by heat, overactive thyroid glands, strong emotion, menopause, or infection.

HYPERINFECTION SYNDROME. A condition of massive infection in which threadworm larvae multiply rapidly and spread throughout the body. It is usually associated with damage to the immune system, the use of steroid medications, or malnutrition.

(c) 2011 Cengage Learning. All Rights Reserved.

HYPERINSULINEMIA. High blood insulin levels.

HYPERKALEMIA. An abnormally high level of potassium in the blood.

HYPERKETONEMIA. Condition characterized by an overproduction of ketones by the body.

HYPERLACTATION. Another term for galactorrhea.

HYPERLIPIDEMIA. Abnormally high levels of lipids in the blood.

HYPERMAGNESEMIA. An abnormally high concentration of magnesium in the blood.

HYPERMOBILITY. Unusual flexibility of the joints, allowing them to be bent or moved beyond their normal range of motion.

HYPEROSMOTIC. Hypertonic, containing a higher concentration of salts or other dissolved materials than normal tissues.

HYPEROSMOTIC DRUGS. Refers to a class of drugs for glaucoma that increase the osmotic pressure in the blood, which then pulls water from the eye into the blood.

HYPERPARATHYROIDISM. Over-functioning of the parathyroid glands. Symptoms include generalized aches and pains, depression, and abdominal pain.

HYPERPIGMENTATION. A skin condition that occurs when the body has too much melanin, or pigment.

HYPERPLASIA. An overgrowth of normal cells within an organ or tissue.

HYPERPLASTIC OBESITY. Excessive weight gain in childhood, characterized by an increase in the number of fat cells.

HYPERSECRETORY. Excessive production of a bodily secretion.

HYPERSENSITIVITY. An excessive response by the body to a foreign substance.

HYPERSOMNIA. An abnormal increase in time spent sleeping, usually accompanied by excessive daytime sleepiness.

HYPERSPLENISM. A syndrome marked by enlargement of the spleen, defects in one or more types of blood cells, and a high turnover of blood cells.

HYPERTENSION. High blood pressure.

HYPERTENSIVE HEART DISEASE. High blood pressure resulting in a disease of the heart.

HYPERTHERMIA THERAPY. A type of treatment in which body tissue is exposed to high temperatures to damage and kill cancer cells or to make cancer cells more sensitive to the effects of radiation and certain anticancer drugs.

HYPERTHYROID. Having too much thyroxin stimulation.

HYPERTHYROIDISM. A condition in which the thyroid gland in the throat is overactive and produces too much thyroid hormone.

HYPERTONIA. Having excessive muscular tone.

HYPERTROPHIC. Enlarged.

HYPERTROPHIC OBESITY. Excessive weight gain in adulthood, characterized by expansion of pre-existing fat cells.

HYPERTROPHY. The overgrowth of body tissue.

HYPERURICEMIA. Excessively high levels of uric acid in the blood.

HYPERVENTILATION. Rapid, deep breathing, possibly exceeding 40 breaths/minute. The most common cause is anxiety.

HYPERVIGILANCE. A condition of abnormally intense watchfulness or wariness. Hypervigilance is one of the most common symptoms of PTSD.

HYPERVISCOSITY. Thick, viscous blood, caused by the accumulation of large proteins, such as immunoglobulins, in the serum.

HYPERVITAMINOSIS. Another name for vitamin toxicity.

HYPNOGOGIC HALLUCINATION. A hallucination, such as the sensation of falling, that occurs at the onset of sleep.

HYPNOPOMPIC HALLUCINATION. A hallucination that occurs as a person is waking from sleep.

HYPNOSIS. An induced trance state, often characterized by extreme relaxation and suggestibility.

HYPNOTIC. A medication that causes sleep.

HYPNOTIC AGENT. A drug capable of inducing a hypnotic state.

HYPNOTIC STATE. A state of heightened awareness that can be used to modulate the perception of pain.

HYPOCALCEMIA. Low blood calcium.

(c) 2011 Cengage Learning. All Rights Reserved.

HYPOCHROMIC. A descriptive term applied to a red blood cell with a decreased concentration of hemoglobin.

HYPOGLYCEMIA. Too little glucose or sugar in the blood.

HYPOGONADISM. Functional incompetence of the male gonads, with impaired production of hormones and germ cells.

HYPOKALEMIA. An abnormally low level of potassium in the blood.

HYPOMAGNESEMIA. An abnormally low concentration of magnesium in the blood.

HYPOMANIA. A less severe form of elevated mood state that is a characteristic of bipolar type II disorder.

HYPONATREMIA. A deficiency of sodium in the blood.

HYPOPARATHYROIDISM. Insufficient production of parathyroid hormone, caused by under-functioning of the parathyroid glands.

HYPOPIGMENTATION. A skin condition that occurs when the body has too little melanin, or pigment.

HYPOPITUITARISM. Underactivity of the pituitary gland.

HYPOPLASIA. Incomplete development of a body tissue or structure.

HYPOPLASTIC. Incomplete or underdevelopment of a tissue or organ. Hypoplastic left heart syndrome is the most serious type of congenital heart disease.

HYPOPLASTIC ANEMIA. Anemia caused by defective function of the blood-forming organs (such as bone marrow).

HYPOPNEA. Shallow or excessively slow breathing usually caused by partial closure of the upper airway during sleep, leading to disruption of sleep.

HYPOPROTEINEMIA. Abnormally low levels of protein in the blood.

HYPOPYON. A small amount of pus or collection of white cells that is visible in the front of the eye in severe cases of anterior uveitis.

HYPOSPADIAS. A congenital deformity of the penis where the urinary tract opening is not at the tip of the glans.

HYPOTENSION. Low blood pressure.

HYPOTHALAMIC-PITUITARY-GONADAL (HPG) AXIS. A term used by doctors to refer to the combined effects of the hypothalamus, the pituitary gland, and the gonads.

HYPOTHALAMUS. A structure within the brain responsible for a large number of normal functions throughout the body, including regulating sleep, body temperature, hunger, and sexual development. The hypothalamus also regulates the functions of the pituitary gland by directing the pituitary to stop or start production of its hormones.

HYPOTHERMIA. Low body temperature.

HYPOTHYROID. Having too little thyroxin stimulation.

HYPOTHYROIDISM. A disorder in which the thyroid gland produces too little thyroid hormone, causing a decreased rate of metabolism.

HYPOTONIA. Reduced or diminished muscle tone.

HYPOVENTILATION. Reduced ventilation in the lungs' air sacs resulting in above normal carbon dioxide pressure.

HYPOVOLEMIC SHOCK. Shock caused by a lack of circulating blood.

HYPOXEMIA. An abnormally low amount of oxygen in the blood, the major consequence of respiratory failure, when the lungs no longer are able to perform their chief function of gas exchange.

HYPOXIA. The medical term for deprivation of an adequate oxygen supply, either to specific tissues or to the entire organism.

HYSTERECTOMY. Removal of the uterus (with or without removal of the ovaries) by surgery. The surgery can be performed through an incision in the abdomen, or the uterus can be removed through the vagina.

HYSTERIA. The earliest term for a psychoneurotic disturbance marked by emotional outbursts and/or disturbances of movement and sense perception. Some forms of hysteria are now classified as somatoform disorders and others are grouped with the dissociative disorders.

HYSTERICAL NEUROSIS. An older term for conversion disorder or dissociative disorder.

HYSTEROSALPINGOGRAPHY; HSG. X raying of the uterus and fallopian tubes following the injection of a contrast dye.

HYSTEROSCOPY. A procedure in which an endoscope is inserted through the cervix to view the cervix and uterus.

(c) 2011 Cengage Learning. All Rights Reserved.

I

I&D. Incision and drainage of a wound.

IATROGENIC. Inadvertently caused by medical treatment.

IATROGENIC KAPOSI'S SARCOMA. A form of Kaposi's sarcoma that develops in transplant patients who take immunosuppressive drugs to prevent rejection of their organ transplant.

ICHTHYOSIS. A group of congenital disorders of keratinization characterized by dryness and scaling of the skin.

ICSI. Stands for intracytoplasmic sperm injection. This process is used to inject a single sperm into each egg before the fertilized eggs are put back into the woman's body. The procedure may be used if the male has a low sperm count.

ICTAL EEG. Used to measure brain activity during a seizure. May be useful in learning more about patients who aren't responding to conventional treatments.

ICTERUS. Jaundice.

IDEAL WEIGHT. Weight corresponding to the lowest death rate for individuals of a specific height, gender, and age.

IDENTIFICATION WITH AN AGGRESSOR. In psychology, an unconscious process in which a person adopts the perspective or behavior patterns of a captor or abuser. Some researchers consider it a partial explanation of Stockholm syndrome.

IDENTIFIED PATIENT (IP). The family member in whom the family's symptom has emerged or is most obvious.

IDIOPATHIC. Refers to a disease that arises from an obscure or unknown cause.

IDIOPATHIC CARDIOMYOPATHY. Cardiomyopathy without a known cause.

IDIOSYNCRASY. A defect in that particular pathway resulting in an abnormality.

ILEUM. The lowest part of the small intestine, located beyond the duodenum and jejunum, just before the large intestine (the colon).

ILEUS. Obstruction of the intestines caused by the absence of peristalsis.

ILIAC ARTERY. Large blood vessel in the pelvis that leads into the leg.

ILIZAROV FRAME. A device invented by a Russian physician for correcting deformities of the legs and feet, consisting of rings to be attached to the bone and rods extending between the rings that stretch the affected limb.

ILLUSION. A false visual perception of an object that others perceive correctly.

IMIQUIMOD. A drug, approved by the FDA to treat warts, that may destroy basal cell carcinomas by stimulating the immune system. Also known by its trade name Aldara.

IMMEDIATE HYPERSENSITIVITY REACTIONS. Allergic reactions that are mediated by mast cells and occur within minutes of allergen contact.

IMMUNE COMPLEXES. Clusters or aggregates of antigen and antibody bound together.

IMMUNE FUNCTION. The body's defense system against bacteria, viruses and fungi, and any malfunction of the organism.

IMMUNE GLOBULIN. Serum containing antibodies against a specific infection.

IMMUNE OR IDIOPATHIC THROMBOCYTOPENIC PURPURA (ITP). A blood disease that results in destruction of platelets, which are blood cells involved in clotting.

IMMUNE RESPONSE. The protective reaction by the immune system against foreign antigens (substances that the body perceives as potentially dangerous). The immune system combats disease by neutralizing or destroying antigens.

IMMUNE SUPPRESSANT DRUG. Any drug that dampens immune responses and decreases inflammation.

IMMUNE SUPPRESSING. Anything that reduces the activity of the immune system.

IMMUNE SYSTEM. The system of specialized organs, lymph nodes, and blood cells throughout the body, which work together to prevent foreign invaders (bacteria, viruses, fungi, etc.) from taking hold and growing.

IMMUNIZATION. Administering a vaccine that stimulates the body to create antibodies to a specific disease (immunity) without causing symptoms of the disease.

IMMUNOCOMPETENCE. An individual's ability to fight off infection.

IMMUNOCOMPROMISED. Refers to conditions in which the immune system is not functioning properly and cannot adequately protect the body from infection.

(c) 2011 Cengage Learning. All Rights Reserved.

IMMUNODEFICIENCY. A disorder in which the immune system is ineffective or disabled due either to acquired or inherited disease.

IMMUNOELECTROPHORESIS. Use of an electrical field to separate proteins in a mixture (such as blood or urine), on the basis of the size and electrical charge of the proteins; followed by the detection of an antigen (such as IgM), using a specific antibody.

IMMUNOFLUORESCENT ASSAY (IFA). A blood test sometimes used to confirm ELISA results instead of using the Western blotting. In an IFA test, HIV antigen is mixed with a fluorescent compound and then with a sample of the patient's blood. If HIV antibody is present, the mixture will fluoresce when examined under ultraviolet light.

IMMUNOGLOBULIN (IG). A substance made by B cells that neutralizes specific disease-causing substances and organisms. Also called "antibody." Immunoglobulins are divided into five classes: IgA, IgD, IgE, IgG, and IgM.

IMMUNOGLOBULIN E (IGE). A type of protein in blood plasma that acts as an antibody to activate allergic reactions. About 50% of patients with allergic disorders have increased IgE levels in their blood serum.

IMMUNOGLOBULIN G (IGG). A group of antibodies against certain viral infections that circulate in the bloodstream. One type of IgG is specific against the mumps paramyxovirus.

IMMUNORESISTANCE. The presence of circulating antibodies.

IMMUNOSUPPRESSANT. Any agent that decreases the response of the immune response of an individual.

IMMUNOSUPPRESSED. A state in which the immune system is suppressed by medications during the treatment of other disorders, such as cancer, or following an organ transplantation.

IMMUNOSUPPRESSION. The use of medications to suppress the immune system to prevent organ rejection.

IMMUNOSUPPRESSIVE CYTOTOXIC DRUGS. A class of drugs that function by destroying cells and suppressing the immune response.

IMMUNOSUPPRESSIVE DRUG. Medication used to suppress the immune system.

IMMUNOTHERAPY. A form of treatment that uses biologic agents to enhance or stimulate normal immune function.

IMPACTED TOOTH. A tooth that is growing against another tooth, bone, or soft tissue.

IMPACTION. A condition in which earwax has become tightly packed in the outer ear to the point that the external ear canal is blocked.

IMPERFORATE ANUS. A congenital malformation (a birth defect) in which the rectum is a blind alley (a cul-de-sac) and there is no anus.

IMPLANT. A fixture with one end implanted into the bone and the other end covered with a crown, often to serve as a stable abutment for a bridge or denture.

IMPLANTABLE CARDIOVERTER-DEFIBRILLATOR. A device placed in the body to deliver an electrical shock to the heart in response to a serious abnormal rhythm.

IMPLANTATION. The process in which the fertilized egg embeds itself in the wall of the uterus.

IMPOTENCE. The inability to achieve and sustain an erection suitable for intercourse.

IMPRESSION. An imprint of the upper or lower teeth made in a pliable material that sets. When this material has hardened, it may be filled with plaster, plastic, or artificial stone to make an exact model of the teeth.

IMPRINTING. Process that silences a gene or group of genes. The genes are silenced depending on if they are inherited through the egg or the sperm.

IN VITRO. A biological reaction occurring in a laboratory apparatus.

IN VIVO. Occurring in a living organism.

INBORN ERROR OF METABOLISM. A rare enzyme deficiency; children with inborn errors of metabolism do not have certain enzymes that the body requires to maintain organ functions. Inborn errors of metabolism can cause brain damage and mental retardation if left untreated. Phenylketonuria is an inborn error of metabolism.

INCARCERATED HERNIA. A hernia that cannot be reduced, or pushed back into place inside the abdominal wall.

INCARCERATION. The abnormal confinement of a section of the intestine or other body tissues. An umbilical hernia may lead to incarceration of part of the intestine.

INCENTIVE SPIROMETER. A breathing device that provides feedback on performance to encourage deep breathing.

(c) 2011 Cengage Learning. All Rights Reserved.

INCEST. Sexual intercourse between people who are too closely related to legally marry.

INCISIONAL BIOPSY. Removal of a part of a lymph node for diagnostic purposes.

INCISORS. The eight front cutting teeth–four in the lower jaw and four in the upper jaw, located between the canines.

INCONTINENCE. Loss of ability to control urination or to control bowel movements (fecal incontinence).

INCREASED INTRACRANIAL PRESSURE. Increased overall pressure inside the skull.

INCUBATION. The time period between exposure to an infectious agent, such as a virus or bacteria, and the appearance of symptoms of illness.

INCUBATION PERIOD. The time it takes for symptoms to develop after initial exposure to a disease-causing organism.

INCUS. The middle of the three bones of the middle ear. It is also known as the "anvil."

INDEX OF REFRACTION. A constant number for any material for any given color of light that is an indicator of the degree of the bending of the light caused by that material.

INDIA INK TEST. A diagnostic test used to detect the cryptococcal organism *C. neoformans*. A dye, called India ink, is added to a sample of CSF fluid, and if the fungi is present, they will become visible as the dye binds to the capsule surrounding the fungus.

INDIGESTION. A feeling of discomfort or illness that results from the inability to properly digest food.

INDIUM. A silvery metallic element with some nonmetallic chemical properties used to label white blood cells prior to scanning.

INDOLENT LYMPHOMA (ALSO CALLED LOW-GRADE). Cancerous growths of lymphoid tissue that progress slowly to more aggressive forms of cancer.

INDURATION. An abnormally hard spot or area on the skin. The tuberculin skin test produces an induration at the test site in persons who have been exposed to TB.

INFANTICIDE. Intentional killing of a child within the first year of life.

INFANTILE SPASMS. Clusters of rapid jerks followed by stiffening or jackknife movements. Usually starts in the first year of life and stops by age 4.

INFARCT. Death of tissue due to shutting off the blood supply.

INFARCTION. An area of dead tissue caused by obstruction of the blood supply to that tissue.

INFECTIOUS DISEASE. Any disease caused by invasion of a pathogen that subsequently grows and multiplies in the body.

INFECTIOUS DISEASE TEAM. A team of physicians who help control the hospital environment to protect patients against harmful sources of infection.

INFERIOR VENA CAVA. The biggest vein in the body, returning blood to the heart from the lower half of the body.

INFERTILITY. The inability of a man and woman to conceive a child after 12 months of unprotected sexual intercourse.

INFESTATION. A condition in which a parasite develops and multiplies on the body of its host rather than inside the body.

INFIBULATION. A procedure that closes the labia majora to prevent sexual intercourse, leaving only a small opening for the passage of urine and menstrual blood.

INFILTRATES. Cells or body fluids that have passed into a tissue or body cavity.

INFILTRATING LOBULAR CARCINOMA. A type of cancer that accounts for 8% to 10% of breast cancers. In breasts that are especially dense, ultrasound can be useful in identifying these masses.

INFILTRATIVE. A process whereby inflammatory or other types of disease spread throughout an organ such as the lungs.

INFLAMED BOWEL. Irritation of the intestinal tract.

INFLAMMATION. The body's reaction to invasion by foreign matter, particularly infection. The result is swelling and redness from an increase in water and blood, and pain from the chemical activity of the reaction.

INFLAMMATORY BOWEL DISEASES. Ulcerative colitis or Crohn's disease: chronic conditions characterized by periods of diarrhea, bloating, abdominal cramps, and pain, sometimes accompanied by weight loss and malnutrition because of the inability to absorb nutrients.

INFLAMMATORY RESPONSE. The immune system's response to tissue injury caused by a physical, chemical, or biological substance.

(c) 2011 Cengage Learning. All Rights Reserved.

INFLUENZA. A virus that affects the respiratory system, causing fever, congestion, muscle aches, and headaches.

INFORMED CONSENT. An educational process between health-care providers and patients intended to instruct the patient about the nature and purpose of the procedure or treatment, the risks and benefits of the procedure, and alternatives, including the option of not proceeding with the test or treatment.

INFRASPINATUS. A muscle at the middle of the shoulder blade.

INFUSION. Introduction of a substance directly into a vein or tissue by gravity flow.

INGUINAL HERNIA. An opening, weakness, or bulge in the lining of the abdominal wall in the groin area, with protrusion of the large intestine.

INHALANT. Medicine that is breathed into the lungs.

INHALATION CHALLENGE TEST. A test given to diagnose asthma by asking the patient to breathe cold air, methacholine, histamine, or another airway irritant and measuring the decline (if any) in the forced expiratory volume (FEV1).

INHERITANCE PATTERN. Refers to dominant or recessive inheritance.

INHIBITION. Restraint of or interference with a biological process, such as the clumping of blood cells.

INJECTION. Forcing a fluid into the body by means of a needle and syringe.

INLAY. A filling that is made outside of the tooth and the cemented into place.

INNER EAR. The interior section of the ear, where sound vibrations and information about balance are translated into nerve impulses.

INNOCENT. The medical term for a harmless heart murmur.

INORGANIC MERCURY. Inorganic compounds such as mercuric oxide (HgO) and mercuric chloride ($HgCl_2$).

INOTROPIC DRUGS. Medications used to stimulate the heart beat.

INPATIENT SURGERY. Surgery that requires an overnight stay of one or more days in the hospital.

INSECTICIDE. A pesticide that kills insects.

INSIDIOUS. Progressing gradually and inconspicuously, but with serious effects.

INSIGHT-ORIENTED THERAPY. An approach to psychotherapy based on helping the client understand the existence of previously unconscious conflicts and the origin of maladaptive behavior in order to change it. Psychoanalysis is one form of insight-oriented therapy.

INSOMNIA. Prolonged or abnormal inability to obtain adequate sleep.

INSPECTION. The visual examination of the body using the eyes and a lighted instrument if needed. The sense of smell may also be used.

INSUFFLATION. Inflation of the abdominal cavity using carbon dioxide; performed prior to laparoscopy to give the surgeon space to maneuver surgical equipment.

INSULIN. A hormone secreted by the pancreas in response to high blood sugar levels that induces hypoglycemia. Insulin regulates the body's use of glucose and the levels of glucose in the blood by acting to open the cells so that they can intake glucose.

INSULIN RESISTANCE. An inability to respond to insulin, a hormone produced by the pancreas that helps the body to use glucose.

INSULINOMA. Tumor that arises from the insulin-producing cells in the pancreas.

INTEGUMENT. The medical name for the skin.

INTENTION TREMOR. A rhythmic purposeless shaking of the muscles that begins with purposeful (voluntary) movement. This tremor does not affect muscles that are resting.

INTERCEPTIVE ORTHODONTICS. Preventative orthodontics; early, simpler orthodontic treatment.

INTERDENTAL. Between the teeth.

INTERFERON. Potent immune–defense protein produced by viral–infected cells. Manufactured interferon is used as an anticancer and antiviral drug.

INTERFERON ALPHA. Potent immune-defense protein; used as an anti-cancer drug.

INTERMITTENT CLAUDICATION. Leg pain and weakness caused by walking.

INTERMITTENT EXPLOSIVE DISORDER. A personality disorder in which an individual is prone to intermittent explosive episodes of aggression during which he or she causes bodily harm or destroys property.

INTERNAL DERANGEMENT. A condition in which the cartilage disc in the temporomandibular joint lies in front of its proper position.

(c) 2011 Cengage Learning. All Rights Reserved.

INTERNATIONAL UNIT (IU). A measurement of biological activity in which one IU is equal to one mg (milligram).

INTERPERSONAL THERAPY. An approach that includes psychoeducation about the sick role, and emphasis on the present and improving interpersonal dynamics and relationships. Interpersonal therapy is effective in treating adjustment disorders related to physical illness.

INTERSTITIAL. Refers to the connective tissue that supports the "working parts" of an organ, in the case of the lungs the air sacs.

INTERSTITIAL CYSTITIS. A chronic inflammatory condition of the bladder involving symptoms of bladder pain, frequent urination, and burning during urination.

INTERSTITIAL FLUID. The fluid between cells in tissues. Referred to as the liquid substance of the body.

INTERSTITIAL LUNG DISEASE. About 180 diseases fall into this category of breathing disorders. Injury or foreign substances in the lungs (such as asbestos fibers) as well as infections, cancers, or inherited disorders may cause the diseases. They can lead to breathing or heart failure.

INTERSTITIAL SPACES. Spaces within body tissues that are outside the blood vessels. Also known as interstitial compartments.

INTERVERTEBRAL DISK. Cylindrical elastic-like gel pads that separate and join each pair of vertebrae in the spine.

INTESTINE. Also called the bowels and divided into large and small intestine, they extend from the stomach to the anus, where waste products exit the body. The small intestine is about 20 ft (6.1m) long and the large intestine, about 5 ft (1.5m) long.

INTOXICATION. The mental, physical, or emotional state produced by a substance.

INTRA-ABDOMINAL PRESSURE. Pressure that occurs within the abdominal cavity. Pressure in this area builds up with coughing, crying, and the pressure exerted when bearing down with a bowel movement.

INTRACELLULAR PARASITE. An organism which can only feed and live within the cell of a different animal.

INTRACEREBRAL HEMORRHAGE. A cause of some strokes in which vessels within the brain begin bleeding.

INTRACRANIAL. Existing or occurring within the cranium; affecting or involving intracranial structures.

INTRACRANIAL HYPERTENSION. Abnormally high blood pressure within the skull.

INTRACUTANEOUS. Into the skin, in this case directly under the top layer of skin.

INTRAMUSCULARLY. A medication given by needle into a muscle.

INTRAOCULAR. Literally, within the eye.

INTRAOCULAR LENS. Lens made of silicone or plastic placed within the eye; can be corrective.

INTRAOCULAR LENS (IOL) IMPLANT. A small, plastic device (IOL) that is usually implanted in the lens capsule of the eye to correct vision after the lens of the eye is removed; used in cataract surgery.

INTRAOCULAR RETINOBLASTOMA. Cancer that is limited to the eye and has not spread to other parts of the body.

INTRATHECAL. Administration of chemotherapy drugs injected into the cerebrospinal fluids which surround the brain and spinal cord.

INTRATHECAL THERAPY. Injecting chemotherapy directly into the CSF using lumbar puncture.

INTRAUTERINE. Situated or occuring in the uterus.

INTRAUTERINE DEVICE (IUD). Contraceptive device consisting of a piece of bent plastic or metal that is inserted through the vagina into the uterus.

INTRAVENOUS. Into a vein; a needle is inserted into a vein in the back of the hand, inside the elbow, or some other location on the body. Fluids, nutrients, and drugs can be injected.

INTRAVENOUS PYELOGRAM (IVP). A procedure in which a dye is injected into a vein in the arm. The dye travels through the body and concentrates in the urine to be discharged. It outlines the kidneys, ureters, and the urinary bladder. An x-ray image is then made and any abnormalities of the urinary tract are revealed.

INTRAVENTRICULAR HEMORRHAGE (IVH). A condition in which blood vessels within the brain burst and bleed into the hollow chambers (ventricles) normally reserved for cerebrospinal fluid and into the tissue surrounding them.

INTRINSIC FACTOR. A substance produced by the parietal cells of the stomach. In order to be absorbed by the intestine, vitamin B_{12} must form a complex with intrinsic factor.

(c) 2011 Cengage Learning. All Rights Reserved.

INTRINSIC PATHWAY. One of three pathways in the coagulation cascade.

INTRINSIC SPHINCTER DEFICIENCY (ISD). A factor in severe stress incontinence due to the inadequacy of the sphincter muscles to keep the bladder closed.

INTUBATION. The insertion of a tube into the patient's airway to protect the airway from collapsing. Intubation is sometimes done as an emergency procedure for patients with epiglottitis.

INTUSSUSCEPTION. The slipping or telescoping of one part of the intestine into the section next to it.

INVASIVE. A diagnostic test that invades healthy tissue; in the case of venography, through an incision in a healthy vein.

INVASIVE SURGERY. A form of surgery that involves making an incision in the patient's body and inserting instruments or other medical devices into it.

ION. An atom or molecule that has an electric charge. In the body ions are collectively referred to as electrolytes.

IONIZING RADIATION. Radiation that can damage living tissue by disrupting and destroying individual cells at the molecular level. All types of nuclear radiation–x rays, gamma rays and beta rays–are potentially ionizing. Sound waves physically vibrate the material through which they pass, but do not ionize it.

IQ. Intelligence quotient; a measure of intellectual functioning determined by performance on standardized intelligence tests.

IRIDO CORNEAL ENDOTHELIAL SYNDROME; ICE. A type of glaucoma in which cells from the back of the cornea spread over the surface of the iris and tissue that drains the eye, forming adhesions that bind the iris to the cornea.

IRIS (PLURAL, IRIDES). The circular pigmented membrane behind the cornea of the eye that gives the eye its color. The iris surrounds a central opening called the pupil.

IRON OVERLOAD. A side effect of frequent blood transfusions in which the body accumulates abnormally high levels of iron. Iron deposits can form in organs, particularly the heart, and cause life–threatening damage.

IRON POISONING. A potentially fatal condition caused by swallowing large amounts of iron dietary supplements.

IRRIGATION. In medicine, the practice of washing out or flushing a wound or body opening with a stream of water or another liquid.

IRRITABLE BOWEL DISEASE. An intestinal disorder often accompanied by abdominal pain and diarrhea.

ISCHEMIA. A condition in which blood flow is cut off or restricted from a particular area. The tissue becomes starved of oxygen and nutrients, resulting in tissue death.

ISCHEMIC. An inadequate supply of blood to a part of the body, caused by partial or total blockage of an artery.

ISCHEMIC HEART DISEASE. Insufficient blood supply to the heart muscle (myocardium).

ISLETS OF LANGERHANS. Special structures in the pancreas responsible for insulin secretion among other functions. They are named for Paul Langerhans, the German researcher who first identified them in 1869.

ISOENZYME. One of a group of enzymes that catalyze the same reaction but are differentiated by variations in physical properties.

ISOMETRIC EXERCISES. Exercises which strengthen through muscle resistance.

ISOSPORA BELLI. A type of parasitic protozoa.

ISOTOPE. Any of two or more species of atoms of a chemical element with the same atomic number and nearly identical chemical behavior but with differing atomic mass and physical properties.

ISOTRETINOIN. A drug for severe acne that decreases sebum production and dries up pimples.

ISOZYME. One of a group of enzymes that perform the same function, but are different from one another in their structure or the way in which they move.

J

JARISCH-HERXHEIMER REACTION. A temporary reaction to penicillin treatment for syphilis that includes fever, chills, and worsening of the skin rash or chancre.

JAUNDICE. A condition that results in a yellow tint to the skin, eyes and body fluids. Bile retention in the liver, gallbladder and pancreas is the immediate cause, but the underlying cause could be as simple as obstruction of the common bile duct by a gallstone or as serious as pancreatic cancer.

(c) 2011 Cengage Learning. All Rights Reserved.

JEJUNOSTOMY. Surgical creation of an opening to the middle portion of the small intestine (jejunum), through the abdominal wall.

JEJUNUM. The middle portion of the small intestine. It is approximately 8 ft (2.5 m) long and extends from the jejunum to the ileum.

JET LAG. A temporary disruption of the body's sleep-wake rhythm following high-speed air travel across several time zones. Jet lag is most severe in people who have crossed eight or more time zones in 24 hours.

JOINT. The point of connection between two bones that allows motion.

JOINT CONTRACTURES. Stiffness of the joints that prevents full extension.

JOINT DISLOCATION. The displacement of a bone.

K

KALLMANN SYNDROME. A rare genetic disorder in which the hypothalamus does not produce enough gonadotropin–releasing hormone, leading to underfunctioning of the testes in males and the ovaries in females.

KAPOSI'S SARCOMA. A cancer of the connective tissue that produces painless purplish red (in people with light skin) or brown (in people with dark skin) blotches on the skin. It is a major diagnostic marker of AIDS.

KARYOTYPE. A standard arrangement of photographic or computer–generated images of chromosome pairs from a cell in ascending numerical order, from largest to smallest.

KARYOTYPING. A laboratory procedure in which chromosomes are separated from cells, stained, and arranged so that their structure can be studied under the microscope.

KEGEL EXERCISES. Repetitive contractions to tone the pubococcygeal muscle of the pelvic floor for enhancing sexual response during intercourse or controlling incontinence.

KELOID. An unusual or abnormal growth of scar tissue, as in the third stage of granuloma inguinale.

KERATIN. A tough, nonwater-soluble protein found in the nails, hair, and the outermost layer of skin. Human hair is made up largely of keratin.

KERATINOCYTES. Cells found in the epidermis. The keratinocytes at the outer surface of the epidermis are dead and form a tough protective layer. The cells underneath divide to replenish the supply.

KERATOCONJUNCTIVITIS. Inflammation of the conjunctiva and cornea of the eye.

KERATOCONUS. An eye condition in which the cornea bulges outward, interfering with normal vision. Usually both eyes are affected.

KERATODERMA BLENNORRHAGICA. The medical name for the patches of scaly skin that occur on the arms, legs, and trunk of RS patients.

KERATOLYTIC. An agent that dissolves or breaks down the outer layer of skin (keratins).

KERATOMALACIA. Keratomalacia is ulceration of the cornea.

KERION. A raised boggy or swollen patch of reddened skin that develops as a complication of ringworm.

KERNICTERUS. A serious condition in which bilirubin deposits in the brain leading to permanent neurological damage and potentially death.

KETOACIDOSIS. A condition due to starvation or uncontrolled Type I diabetes. Ketones are acid compounds that form in the blood when the body breaks down fats and proteins. Symptoms include abdominal pain, vomiting, rapid breathing, extreme tiredness, and drowsiness.

KETOGENIC DIET. A diet that supplies an abnormally high amount of fat, and small amounts of carbohydrates and protein.

KETONES. Poisonous acidic chemicals produced by the body when fat instead of glucose is burned for energy. Breakdown of fat occurs when not enough insulin is present to channel glucose into body cells.

KETOSIS. An abnormal increase in ketones in the body, usually found in people with uncontrolled diabetes mellitus.

KIDNEY. Either of two organs in the lumbar region that filter the blood, excreting the end products of the body's metabolism in the form of urine and regulating the concentrations of hydrogen, sodium, potassium, phosphate and other ions in the body.

KIDNEY DIALYSIS. A process during which blood is filtered through a dialysis machine to remove waste products that would normally be removed by the kidneys. The filtered blood is then circulated back into the patient. This process also is called renal dialysis.

(c) 2011 Cengage Learning. All Rights Reserved.

KIDNEY DISEASE. Any disorder that impairs the kidney's ability to remove waste and toxins from the body.

KIDNEY FAILURE. The inability of the kidney to excrete toxic substances from the body.

KIDNEY STONE. A hard mass that forms in the urinary tract and can cause pain, bleeding, obstruction, or infection. Stones are primarily made up of calcium.

KIESSELBACH'S PLEXUS. An area on the anterior part of the nasal septum that has a rich supply of blood vessels and is a common site of nosebleeds. It is named for Wilhelm Kiesselbach, a nineteenth-century German otolaryngologist.

KINESIOLOGY. The study of the anatomy and physiology of body movement.

KLEINE-LEVIN SYNDROME. A disorder that occurs primarily in young males, with episodes three or four times a year. The syndrome is marked by bouts of hypersomnia, hypersexual behavior, and excessive eating.

KLEPTOMANIA. An impulse control disorder characterized by the overwhelming urge to steal.

KLINEFELTER SYNDROME. A condition caused by extra X chromosome(s) in a male, which results in small testes and infertility together with increased height, decreased facial hair, and sometimes breast enlargement.

KOCK POUCH. A type of ileostomy in which the surgeon forms an artificial rectum from a section of the ileum. A Kock pouch is sometimes called a continent ileostomy because it is drained with a tube.

KOH. The chemical formula for potassium hydroxide, which is used to perform the KOH test. The test is also called a potassium hydroxide preparation.

KOPLIK'S SPOTS. Tiny spots occurring inside the mouth, especially on the inside of the cheek. These spots consist of minuscule white dots (like grains of salt or sand) set onto a reddened bump. Unique to measles.

KOSHER. Conforming to Jewish dietary laws.

KWASHIORKOR. Severe malnutrition in children primarily caused by a protein-poor diet, characterized by growth retardation.

KYPHOSCOLIOSIS. Abnormal front-to-back and side-to-side curvature of the spine.

KYPHOSIS. An abnormal outward curvature of the spine, with a hump at the upper back.

L

LABIA. The fatty folds of the vulva.

LABIA MAJORA. Major lips; mounds of tissue forming the lateral boundaries of the vulva.

LABIA MINORA. Minor lips; narrow folds of tissue between the labia major, on either side of the urethral and vaginal openings.

LABOR. The process during which the uterus contracts and the cervix opens to allow the passage of a baby into the vagina.

LABYRINTH. The bony cavity of the inner ear.

LACERATION. Also called a tear. Separation of skin or other tissue by a tremendous force, producing irregular edges.

LACRIMAL DUCT. A short canal leading from a small orifice at the medial angle of each eyelid to the lacrimal sac.

LACRIMAL GLAND. An almond-shaped gland that secretes tears.

LACRIMAL SAC. The dilated upper end of the nasolacrimal duct in which the lacrimal ducts empty.

LACTASE. The enzyme needed to break down lactose, the sugar found in milk.

LACTASE ENZYME. The enzyme produced by cells lining the small intestine that allows the body to break down lactose.

LACTATION. Secretion of milk from the breasts; the act of breastfeeding.

LACTIC ACIDOSIS. A serious condition caused by the build up of lactic acid in the blood, causing it to become excessively acidic. Lactic acid is a by-product of glucose metabolism.

LACTOBACILLUS ACIDOPHILUS. A bacteria found in yogurt that changes the balance of the bacteria in the intestine in a beneficial way.

LACTOSE. A sugar found in milk that provides energy.

LACTOSE INTOLERANCE. An inability to properly digest milk and dairy products.

LAMELLAR ICHTHYOSIS. Also called fish scale disease, this inherited condition is characterized by darkened, scaly, dry patches of skin.

LAMINAE (SINGULAR, LAMINA). The broad plates of bone on the upper surface of the vertebrae that fuse

(c) 2011 Cengage Learning. All Rights Reserved.

together at the midline to form a bony covering over the spinal canal.

LAMINARIA. A medical product made from a certain type of seaweed that is physically placed near the cervix to cause it to dilate.

LAMINECTOMY. An operation in which the surgeon cuts through the covering of a vertebra to reach a herniated disk in order to remove it.

LAMINOTOMY. A less invasive alternative to a laminectomy in which a hole is drilled through the lamina.

LANUGO. A soft, downy body hair that develops on the chest and arms of anorexic women.

LAPAROSCOPE. A pencil-thin telescope that allows surgery to be done through half-inch incisions.

LAPAROSCOPIC. A minimally invasive surgical or diagnostic procedure that uses a flexible endoscope (laparoscope) to view and operate on structures in the abdomen.

LAPAROSCOPIC CHOLECYSTECTOMY. Removal of the gallbladder using a laparoscope, a fiberoptical instrument inserted through the abdomen.

LAPAROSCOPIC PROCEDURES. Surgical procedures performed using a laparoscope—a pencil-thin instrument that has its own lighting system and miniature video camera. To perform surgeries, only small incisions are needed to insert the instruments and the miniature camera.

LAPAROSCOPIC SURGERY. A minimally invasive surgery in which a camera and surgical instruments are inserted through a small incision.

LAPAROSCOPY. Procedure using a laparoscope to view organs, obtain tissue samples, and perform surgery.

LAPAROTOMY. Surgical incision into the abdomen to locate, repair, and/or remove injured or diseased tissues.

LARGE CORE NEEDLE BIOPSY. A procedure using a thicker needle to remove a core of tissue, about the size of a grain of rice, from the breast.

LARVA. The immature, early form of an organism that at birth or hatching is not like its parent and has to undergo metamorphosis before assuming adult features.

LARYNGECTOMY. Surgical removal of the larynx to treat cancer.

LARYNGITIS. Inflammation of the larynx (voice box).

LARYNGOSCOPE. A diagnostic instrument that is used to examine the interior of the larynx.

LARYNGOSCOPY. A medical procedure that uses flexible, lighted, narrow tubes inserted through the mouth or nose to examine the larynx and other areas deep inside the neck.

LARYNGOSPASM. Spasm of the larynx.

LARYNX. Also known as the voice box, the larynx is composed of cartilage that contains the apparatus for voice production. This includes the vocal cords and the muscles and ligaments that move the cords.

LASER. A device that concentrates electromagnetic radiation into a narrow beam and treats tissue quickly without heating surrounding areas.

LASER CYCLOPHOTOCOAGULATION. A procedure used for severe glaucoma in patients who have not responded well to previous treatments. The laser partially destroys the tissues that make the fluid of the eye.

LASER PERIPHERAL IRIDOTOMY. This procedure makes a drainage hole in the iris allowing the fluid to drain from the eye.

LASER TRABECULOPLASTY. In this procedure, the laser attempts to open the normal drainage channels of the eye so fluid can drain more effectively.

LASER-ASSISTED IN-SITU KERATOMILEUSIS (LASIK). A surgical procedure that uses a cutting tool and a laser to modify the cornea and correct moderate to high levels of myopia.

LATCH-ON. The process whereby the baby opens the mouth widely and first exerts negative pressure on the mother's nipple and then positive pressure. Good latch-on will result in adequate transfer of milk into the baby's mouth and prevent sore nipples from occurring.

LATE DECELERATION. Transient slowing of the fetal heart (brachycardia), which reaches its height more than 30 seconds after the peak of the uterine contraction and may indicate the fetus is not receiving enough oxygen (hypoxia).

LATENCY. The period of inactivity between the time a stimulus is provided and the time a response occurs.

LATENT VIRUS. An inactive virus that is in a dormant state within a cell.

(c) 2011 Cengage Learning. All Rights Reserved.

LATEX. A rubber material that gloves and condoms are made from.

LAVAGE. The washing out of a hollow body organ—for example, the stomach—using a flow of water.

LAW OF SIMILARS. The basic principle of homeopathic medicine that governs the selection of a specific remedy. It holds that a substance of natural origin that produces certain symptoms in a healthy person will cure those same symptoms in a sick person.

LAXATIVE. Material that encourages a bowel movement.

LDL CHOLESTEROL. Low-density lipoprotein cholesterol is the primary cholesterol molecule. High levels of LDL increase the risk of coronary heart disease. LDL is nicknamed "bad cholesterol."

LEAD. Name given the electrode when it is attached to the skin.

LEARNING DISORDER. An impairment of the cognitive processes of understanding and using spoken and written language that results in difficulties with one or more academic skill sets (e.g., reading, writing, mathematics).

LEEP. Loop Electrosurgical Excision Procedure.

LEFT ANTERIOR DESCENDING CORONARY ARTERY (LAD). One of the branches of the heart's left main coronary artery that supplies blood to the left ventricle.

LEFT VENTRICLE. The large chamber on the lower left side of the heart. The left ventricle sends blood to the aorta and the rest of the body.

LEGIONELLOSIS. A disease caused by infection with a *Legionella* bacterium.

LEGUME. Group of plant foods including beans, peas, and lentils, which are high in protein, fiber, and other nutrients.

LEISHMAN-DONOVAN BODY. A body of a (trypanosomatid) protozoa at a particular and characteristic stage in its life cycle; the infectious (trypanosomatid) protozoa can cause leishmaniasis.

LENS. The transparent, elastic, curved structure behind the iris (colored part of the eye) that helps focus light on the retina.

LENTICONUS. A rare, usually congenital condition in which the surface of the lens of the eye is conical.

LEPTIN. A peptide hormone produced by fat cells that acts on the hypothalamus to suppress appetite and burn stored fat.

LESION. Any visible, local abnormality of the tissues of the skin, such as a wound, sore, rash, or boil.

LET. A topical anesthetic mixture containing lidocaine, epinephrine, and tetracaine.

LETHARGY. The state of being sluggish.

LEUKEMIA. A cancer of blood cells characterized by the abnormal increase in the number of white blood cells in the tissues. There are many types of leukemias and they are classified according to the type of white blood cell involved.

LEUKEMIA STAINS. Special stains added to smears of blood or bone marrow, performed to diagnose and classify leukemia.

LEUKOCORIA. A pupil reflex that is white instead of red or that has white spots.

LEUKOCYTE. A white blood cell. Leukocytes protect the body against infection and fight infection when it occurs; they are bigger than red blood cells.

LEUKOCYTE ADHESION DEFICIENCY SYNDROME. A complement deficiency syndrome characterized by recurrent infections of the skin, mucous membranes, and gastrointestinal tract and the absence of pus formation. This disorder is sometimes apparent at birth when separation of the umbilical cord takes longer than normal.

LEUKOCYTE ALKALINE PHOSPHATASE (LAP) TEST. A blood test that measures the level of enzyme activity in a type of white blood cell called neutrophils.

LEUKOCYTOSIS. An increased level of white cells in the blood. Leukocytosis is a common reaction to infections.

LEUKODYSTROPHY. Any of several inherited diseases characterized by the degeneration of myelin in the brain, spinal cord, and peripheral nerves.

LEUKOPENIA. A white blood cell count decreased to less than 4,000/μL.

LEUKOTRIENES. A class of small molecules produced by cells in response to allergen exposure; they contribute to allergy and asthma symptoms.

LEVODOPA (L–DOPA). A substance used in the treatment of Parkinson's disease. Levodopa can cross the blood-brain barrier that protects the brain. Once in the brain, it is converted to dopamine and thus can replace the dopamine lost in Parkinson's disease.

(c) 2011 Cengage Learning. All Rights Reserved.

LEVONORGESTREL. A synthetic progestin used in emergency contraceptive pills.

LEWY BODIES. Areas of injury found on damaged nerve cells in certain parts of the brain associated with dementia.

LEYDIG CELLS. Cells that make up the endocrine tissue of the testis and produce testosterone. They are named for Franz von Leydig (1821–1908), the German professor of anatomy who first identified them.

LICHEN PLANUS. A noncancerous, chronic, itchy skin disease that causes small, flat, purple plaques on the wrists, forearms, and ankles.

LICHEN SIMPLEX CHRONICUS. A skin disorder accompanied by severe itching that causes thick, dark patches of skin to develop.

LIGAMENT. A type of connective tissue that connects bones or cartilage and provides support and strength to joints.

LIGAMENTA FLAVA (SINGULAR, LIGAMENTUM FLAVUM). A series of bands of tissue that are attached to the vertebrae in the spinal column. They help to hold the spine straight and to close the spaces between the laminar arches. The Latin name means "yellow band(s)."

LIMB-GIRDLE MUSCULAR DYSTROPHY. An autosomal recessive form of muscular dystrophy that appears anywhere from late childhood to middle age and is characterized by progressive muscular weakness beginning either in the shoulder or pelvic girdle; the disease usually progresses slowly with cardiopulmonary complications in the later stages.

LIMBIC SYSTEM. A group of structures in the brain that includes the hypothalamus, amygdala, and hippocampus. The limbic system plays an important part in regulation of human moods and emotions. Many psychiatric disorders are related to malfunctioning of the limbic system.

LIMITED SCLERODERMA. A subtype of systemic scleroderma with limited skin involvement. It is sometimes called the CREST form of scleroderma, after the initials of its five major symptoms.

LIMITED SUPPORT. A predetermined period of assistance required to deal with a specific event, such as training for a new job.

LINDANE. An organic chloride, neurotoxic insecticide that kills lice.

LINGUAL TONSILS. A pair of small tonsils located on the upper side of the base of the tongue.

LINOLEIC ACID. An unsaturated omega-6 fatty acid found in many plant oils that humans need in their diet. Plant oils rich in linoleic acid are beneficial to the skin when used in massage.

LIPASE. A fat-splitting enzyme found in pancreatic juice, blood, and many tissues.

LIPIDS. A group of fats and fat-like substances that are not soluble in water, are stored in the body, and serve as a source of fuel for the body.

LIPODYSTROPHY. The medical term for redistribution of body fat in response to highly active antiretroviral therapy, insulin injections in diabetics, or rare hereditary disorders.

LIPOMA. A usually benign tumor of fatty tissue.

LIPOPROTEIN. A complex molecule that consists of a protein membrane surrounding a core of lipids. Lipoproteins carry cholesterol and other lipids from the digestive tract to the liver and other body tissues. There are five major types of lipoproteins.

LIPOSHAVING. Involves removing fat that lies closer to the surface of the skin by using a needle-like instrument that contains a sharp-edged shaving device.

LIPOSUCTION. A cosmetic surgery technique for removing unwanted fat cells from the abdomen, hips, thighs, or male breast while doing as little damage as possible to nearby connective tissue and blood vessels.

LISTERIOSIS. A food-borne bacterial infection caused by *Listeria monocytogenes* to which pregnant women are particularly susceptible.

LITHIUM (LITHANE, LITHROMATE). Medication prescribed to treat manic (excited) phases of bipolar disorder.

LITHOTRIPSY. A nonsurgical technique for removing gallstones by breaking them apart with high-frequency sound waves.

LIVER. A solid organ located on the right in the upper abdomen. It plays a major role in metabolism, digestion, detoxification, and elimination of substances from the body.

LIVER BIOPSY. A surgical procedure where a small piece of the liver is cut out for examination. A needle or narrow tube may be inserted either directly through the skin and muscle or through a small incision and passed into the liver for collection of a sample of liver tissue.

(c) 2011 Cengage Learning. All Rights Reserved.

LIVER ENCEPHALOPATHY. A condition in which the brain is affected by a buildup of toxic substances that would normally be removed by the liver. The condition occurs when the liver is too severely damaged to cleanse the blood effectively.

LIVER FUNCTION TESTS. Tests used to evaluate liver metabolism, storage, filtration, and excretion. The tests include alkaline phosphatase, alanine aminotransferase, and aspartate aminotransferase.

LIVING WILL. A legal document detailing a person's wishes during the end of life, to be carried out by designated decision makers.

LOBAR. Relating to a lobe.

LOBAR HEMORRHAGE. Bleeding into one of the lobes of the brain.

LOBULES. A small lobe or subdivision of a lobe (often on a gland) that may be seen on the surface of the gland by bumps or bulges.

LOCAL ANESTHETIC. Medication applied topically to the skin or administered through an injection that deadens a specific part of the body and inhibits the sensation of pain.

LOCALIZED. Confined to a small area.

LOCALIZED SCLERODERMA. Thickening of the skin from overproduction of collagen.

LOCUS CERULEUS. Area in the brain stem that processes sensory signals from all areas of the body.

LODESTONE. A variety of magnetite that possesses magnetic polarity.

LOEFFLER'S MEDIUM. A special substance used to grow diphtheria bacilli to confirm a diagnosis.

LOEFFLER'S SYNDROME. The respiratory phase of ascariasis, marked by inflammation of the lungs and eosinophilia.

LONG-STRETCH BANDAGES. Specialized bandages, similar to an Ace bandage, that have 100% to 200% stretch.

LOOP ELECTROSURGICAL EXCISION (LEEP). A procedure that can help diagnose and treat cervical abnormalities using a thin wire loop that emits a low-voltage high-frequency radio wave that can excise tissue.

LOW TRANSVERSE INCISION. Incision made horizontally across the lower end of the uterus.

LOW-DENSITY LIPOPROTEIN (LDL). A type of lipoprotein that consists of about 50% cholesterol and is associated with an increased risk of coronary artery disease.

LOWER ESOPHAGEAL SPHINCTER (LES). A muscular ring at the base of the esophagus that keeps stomach contents from entering back into the esophagus.

LOWER EXTREMITY AMPUTATION. To cut a limb from the lower body.

LOW-STRETCH BANDAGE. Specialized bandages with 30% to 90% stretch that are used to obtain the correct compression during the treatment of lymphedema; also known as short-stretch bandages.

LUES MALIGNA. Areas of ulcerated and dying skin tissue that may occur with secondary syphilis, most frequently in HIV-positive patients.

LUGOL'S SOLUTION. A strong iodine solution.

LUMBAR. Pertaining to the part of the back between the chest and the pelvis.

LUMBAR PUNCTURE. Also called a spinal tap, a procedure in which a thin needle is used to withdraw a sample of cerebrospinal fluid for diagnostic purposes from the area surrounding the spine.

LUMBAR SPINE. The segment of the human spine above the pelvis that is involved in low back pain. There are five vertebrae, or bones, in the lumbar spine.

LUMBAR VERTEBRAE. The vertebrae of the lower back below the level of the ribs.

LUMBOSACRAL. Referring to the lower part of the backbone or spine.

LUMEN. The cavity or channel inside a blood vessel or tube-shaped organ.

LUMPECTOMY. A surgical procedure in which only the cancerous tumor in the breast is removed, together with a rim of normal tissue.

LUNG FUNCTION TESTS. Tests of how much air the lungs can move in and out, and how quickly and efficiently this can be done. Lung function tests are usually done by breathing into a device that measures air flow.

LUNG NODULE. See pulmonary nodule.

LUPUS (SYSTEMIC LUPUS ERYTHEMATOSUS OR SLE). A chronic inflammatory autoimmune disorder that may affect many organ systems including the skin, joints, and internal organs.

LUTEINIZING HORMONE. A hormone secreted by the pituitary gland that regulates the menstrual cycle

(c) 2011 Cengage Learning. All Rights Reserved.

and triggers ovulation in females. In males, it stimulates the testes to produce testosterone.

LUTEINIZING HORMONE RELEASING HORMONE (LHRH) AGONIST. A substance that blocks the action of LHRH, a hormone that stimulates the production of testosterone (a male hormone) in men. Used to treat prostate cancers that require testosterone for growth.

LUTROPIN. Another term for luteinizing hormone, this hormone stimulates the development and release of the egg from the ovary.

LUX. The International System unit for measuring illumination, equal to one lumen per square meter.

LUXATE. To loosen or dislocate the tooth from the socket.

LYME DISEASE. An acute recurrent inflammatory disease involving one or a few joints, believed to be transmitted by a tick-borne virus. The condition was originally described in the community of Lyme, Connecticut, but has also been reported in other parts of the United States and other countries. Knees and other large joints are most commonly affected, with symptoms including local inflammation and swelling.

LYMPH. A clear fluid that contains cells important in forming antibodies that fight infection; also known as lymphatic fluid.

LYMPH NODE DISSECTION. Surgical removal of a group of lymph nodes.

LYMPH NODES. Oval-shaped organs the size of peas that are located throughout the body and contain clusters of cells called lymphocytes. They filter out and destroy bacteria, foreign particles, and cancerous cells from the blood.

LYMPHANGIOGRAPHY. Injection of dye into lymphatic vessels followed by x rays of the area. It is a difficult procedure, as it requires surgical isolation of the lymph vessels to be injected.

LYMPHANGITIS. Inflammation of the lymphatic vessels. It often occurs together with lymphadenitis.

LYMPHATIC SYSTEM. Also referred to as the lymph system, a network of vessels, nodes, and organs responsible for filtering and transporting fluid and nutrients to the bloodstream; serves as an important part of the immune system.

LYMPHATIC VESSELS. Vessels that carry lymph from the tissues to the bloodstream; also referred to as lymph channels or lymphatics.

LYMPHEDEMA. The unnatural accumulation of lymph in the tissues of the body, which results in swelling in that area.

LYMPHOCYTES. Type of white blood cells that are part of the immune system. The lymphocytes are composed of three main cell lines: B lymphocytes, T lymphocytes, and natural killer (NK) cells.

LYMPHOCYTOSIS. A condition in which the number of lymphocytes increases above normal levels.

LYMPHOID. Tissues relating to the lymphatic system.

LYMPHOID TISSUE. Sites within the body that produce cells of the immune system, including lymph nodes, bone marrow, and the thymus.

LYMPHOMA. A blood cancer in which lymphocytes, a variety of white blood cells, grow at an unusually rapid rate.

LYMPHOPENIA. A condition in which the number of lymphocytes falls below normal levels.

LYMPHOSCINTIGRAPHY. A technique in which a radioactive substance that concentrates in the lymphatic vessels is injected into the affected tissue and mapped using a gamma camera, which images the location of the radioactive tracer.

LYSOSOME. Membrane-enclosed compartment in cells, containing many hydrolytic enzymes, where large molecules and cellular components are broken down.

LYSSAVIRUS. A genus of viruses that includes the rabies virus and related viruses that infect insects as well as mammals.

LYSYL OXIDASE. An enzyme required for the cross-linking of elastin and collagen molecules to form properly functioning connective tissue.

M

M PROTEIN. Monoclonal or myeloma protein; abnormal antibody found in large amounts in the blood and urine of individuals with multiple myeloma.

MACROBIOTIC DIET. A diet based primarily on whole grains, vegetables, and beans, avoiding refined or processed foods.

MACROCYTIC. A descriptive term applied to a larger-than-normal red blood cell.

MACROMASTIA. Excessive size of the breasts.

(c) 2011 Cengage Learning. All Rights Reserved.

MACROPHAGE. A cell of the immune system that engulfs and digests foreign invaders such as bacteria and viruses in an attempt to stop them from causing disease within the body.

MACULA. The sensitive center of the retina that is responsible for detailed central vision.

MACULAR DEGENERATION. A condition usually associated with age in which the area of the retina called the macula is impaired due to hardening of the arteries (arteriosclerosis). This condition interferes with vision.

MACULE. A flat, discolored area on the skin.

MACULOPAPULAR RASH. A rash characterized by raised, spotted lesions.

MAGNETIC FIELD. The three-dimensional area surrounding a magnet, in which its force is active.

MAGNETIC RESONANCE ANGIOGRAPHY. A noninvasive diagnostic technique that uses radio waves to map the internal anatomy of the blood vessels.

MAGNETIC RESONANCE IMAGING (MRI). An imaging technique that uses a large circular magnet and radio waves to generate signals from atoms in the body. These signals are used to construct images of internal structures.

MAJOR DEPRESSIVE DISORDER. A mood disorder characterized by profound feelings of sadness or despair.

MAJOR TRANQUILIZERS. The family of drugs that includes the psychotropic or neuroleptic drugs, sometimes used to help autistic people. They carry significant risk of side effects, including Parkinsonism and movement disorders, and should be prescribed with caution.

MALABSORPTION. Poor absorption of materials in the digestive system.

MALABSORPTION SYNDROME. A condition characterized by indigestion, bloating, diarrhea, loss of appetite, and weakness, caused by poor absorption of nutrients from food.

MALADAPTIVE. Unsuitable or counterproductive; for example, maladaptive behavior is behavior that is inappropriate to a given situation.

MALARIA. Disease caused by the presence of sporozoan parasites of the genus *Plasmodium* in the red blood cells, transmitted by the bite of anopheline mosquitoes, and characterized by severe and recurring attacks of chills and fever.

MALATHION. An organic phosphate, neurotoxic insecticide that kills lice.

MALIGNANCY. A locally invasive and destructive growth.

MALIGNANT. The term literally means growing worse and resisting treatment. It is used as a synonym for cancerous and connotes a harmful condition that generally is life threatening.

MALIGNANT HYPERTHERMIA. A type of reaction (probably with a genetic origin) that can occur during general anesthesia and in which the patient experiences a high fever, muscle rigidity, and irregular heart rate and blood pressure.

MALIGNANT MELANOMA. A potentially fatal form of skin cancer that develops from melanocytes, which are skin cells containing melanin.

MALIGNANT MESOTHELIOMA. A cancer of the pleura (the membrane lining the chest cavity and covering the lungs) that typically is related to asbestos exposure.

MALIGNANT TUMOR. An abnormal proliferation of cells that can spread to other sites.

MALINGERING. Pretending to be sick in order to be relieved of an unwanted duty or obtain some other obvious benefit.

MALLEUS. One of the three bones of the middle ear; also known as the "hammer."

MALOCCLUSION. The misalignment of opposing teeth in the upper and lower jaws.

MAMMARY ARTERY. A chest wall artery that descends from the aorta and is commonly used for bypass grafts.

MAMMARY HYPERPLASIA. Increased size of the breast.

MAMMOGRAM. A set of x rays taken of the front and side of the breast; used to diagnose various abnormalities of the breast.

MAMMOGRAPHY. X-ray imaging of the breast that can often detect lesions in the tissue too small or too deep to be felt.

MAMMOPLASTY. Surgery performed to change the size or shape of breasts.

MAMMOTOME. A method for removing breast biopsies using suction to draw tissue into an opening in the side of a cylinder inserted into the breast tissue.

(c) 2011 Cengage Learning. All Rights Reserved.

A rotating knife then cuts tissue samples from the rest of the breast; also known as a vacuum-assisted biopsy.

MANDALA. A design, usually circular, that appears in religion and art. In Buddhism and Hinduism, the mandala has religious ritual purposes and serves as a yantra (a geometric emblem or instrument of contemplation).

MANDIBLE. The lower jaw, a U–shaped bone attached to the skull at the temporomandibular joints.

MANIA. A mood disorder in which a person experiences prolonged elation or irritability characterized by overactivity that can lead to exhaustion and medical emergencies.

MANOMETER. A device used to measure fluid pressure.

MANOMETRY. Measurement of pressure.

MANTOUX TEST. A tuberculin skin test; also called the PPD (purified protein derivative) test.

MANTRA. A sacred word or formula repeated over and over to concentrate the mind.

MAO-B INHIBITORS. Inhibitors of the enzyme monoamine oxidase B. MAO-B helps break down dopamine; inhibiting it prolongs the action of dopamine in the brain.

MARASMUS. Severe malnutrition in children caused by a diet lacking in calories as well as protein. Marasmus may also be caused by disease and parasitic infection.

MARFAN SYNDROME. An inheritable disorder that affects the skeleton, joints, and blood vessels. Major indicators are excessively long arms and legs, lax joints, and vascular defects.

MARSUPIALIZATION. Cutting out a wedge of the cyst wall and putting in stitches so the cyst cannot reoccur.

MARTIAL ARTS. Group of diverse activities originating from ancient Asian fighting techniques.

MASOCHISM. Sexual arousal by having pain and/or humiliation inflicted upon oneself.

MAST CELLS. A type of immune system cell that is found in the lining of the nasal passages and eyelids, displays a type of antibody called immunoglobulin type E (IgE) on its cell surface, and participates in the allergic response by releasing histamine from intracellular granules.

MASTECTOMY, MODIFIED RADICAL. Total mastectomy with axillary lymph node dissection, but with preservation of the pectoral muscles.

MASTECTOMY, RADICAL. Removal of the breast, pectoral muscles, axillary lymph nodes, and associated skin and subcutaneous tissue.

MASTECTOMY, SIMPLE. Removal of only the breast tissue, nipple and a small portion of the overlying skin.

MASTOID BONE. The prominent bone behind the ear that projects from the temporal bone of the skull.

MASTOID PROCESS. The protrusions of bone behind the ears at the base of the skull.

MASTOIDITIS. An inflammation of the bone behind the ear (the mastoid bone) caused by an infection spreading from the middle ear to the cavity in the mastoid bone.

MASTOPEXY. Surgical procedure to lift up a breast. May be used on opposite breast to achieve symmetrical appearance with a reconstructed breast.

MATCH. How similar the HLA typing, out of a possible six antigens, is between a donor and a recipient.

MATERNAL. From one's mother.

MATERNAL BLOOD SCREENING. Maternal blood screening is normally done early in pregnancy to test for a variety of conditions. Abnormal amounts of certain proteins in a pregnant woman's blood raise the probability of fetal defects. Amniocentesis is recommended if such a probability occurs.

MATERNAL SERUM ANALYTE SCREENING. A medical procedure in which a pregnant woman's blood is drawn and analyzed for the levels of certain hormones and proteins. These levels can indicate whether there may be an abnormality in the unborn child. This test is not a definitive indicator of a problem and is followed by more specific testing such as amniocentesis or chorionic villus sampling.

MATERNAL UNIPARENTAL DISOMY. Chromosome abnormality in which both chromosomes in a pair are inherited from one's mother.

MATRIX. The tissue at the base of the nail, from which the nail grows.

MATURATION. The process by which stem cells transform from immature cells without a specific function into a particular type of blood cell with defined functions.

(c) 2011 Cengage Learning. All Rights Reserved.

MAXILLA. The bone of the upper jaw, which serves as a foundation of the face and supports the orbits.

MCCUNE-ALBRIGHT SYNDROME (MCAS). A genetic syndrome characterized in girls by the development of ovarian cysts and puberty before the age of 8, together with abnormalities of bone structure and skin pigmentation.

MCH–1. Major histocompatibility complex proteins that protect cells from invasion.

MEAN CORPUSCULAR HEMOGLOBIN (MCH). A measurement of the average weight of hemoglobin in a red blood cell.

MEAN CORPUSCULAR HEMOGLOBIN CONCENTRATION (MCHC). The measurement of the average concentration of hemoglobin in a red blood cell.

MEAN CORPUSCULAR VOLUME (MCV). A measure of the average volume of a red blood cell.

MEASLES. An acute and highly contagious viral disease marked by distinct red spots followed by a rash that occurs primarily in children.

MEASLES ENCEPHALITIS. A serious complication of measles occurring in about one out of every 1,000 cases, causing headache, drowsiness, and vomiting seven to ten days after the rash appears. Seizures and coma can follow, which may lead to retardation and death.

MECHANICAL VALVE. An artificial device used to replace the patient's heart valve. They include three types: ball valve, disk valve, and bileaflet valve.

MECONIUM. A greenish fecal material that forms the first bowel movement of an infant.

MECONIUM ASPIRATION SYNDROME. Breathing in of meconium by a fetus or newborn, which can block air passages and interfere with lung expansion.

MEDIA. Substance that contains all the nutrients necessary for bacteria to grow in a culture.

MEDIAL WALL. The middle bone, or wall, of the eye's orbit. It is generally thicker than the roof and floor walls.

MEDIAN NERVE. A nerve that runs through the wrist and into the hand. It provides sensation and some movement to the hand, the thumb, the index finger, the middle finger, and half of the ring finger.

MEDIASTINOSCOPY. A procedure that allows the physician to see the organs in the mediastinal space using a thin, lighted, hollow tube (a mediastinoscope).

MEDIASTINUM. The area between the lungs, bounded by the spine, breastbone, and diaphragm.

MEDITATION. Technique of concentration for relaxing the mind and body.

MEDULLA OBLONGATA. The lowest section of the brainstem, located next to the spinal cord. The medulla is the site of important cardiac and respiratory regulatory centers.

MEDULLARY THYROID CANCER (MTC). A slow-growing tumor associated with multiple endocrine neoplasia.

MEFLOQUINE. An antimalarial drug that was developed by the United States Army in the early 1980s. Today, malaria resistance to this drug has become a problem in some parts of Asia (especially Thailand and Cambodia).

MEGACOLON. Abnormally large colon associated with some chronic intestine disorders.

MEGADOSE. A very large dose of a vitamin, taken by some people as a form of self-medication.

MEGAKARYOCYTE. A large bone marrow cell that is responsible for the production of platelets, which are active in blood clotting.

MEGALOBLAST. A large erythroblast (a red marrow cell that synthesizes hemoglobin).

MEIBOMIAN GLAND. Oil-producing glands in the eyelids that open near the eyelid margins.

MELANIN. A pigment that is responsible for the color of hair, skin, and eyes. Melanin also protects the body by absorbing ultraviolet light.

MELANOCYTE. An epidermal skin cell that produces melanin.

MELANOMA. A rapidly spreading and deadly form of cancer that usually occurs on the skin.

MELASMA. A dark mask-like discoloration that covers the cheeks and bridge of the nose. Also called "the mask of pregnancy."

MELATONIN. A hormone produced by the pineal gland that is associated with sleep, and that may be useful in the treatment of some sleep disorders.

MEMBRANE OXYGENATOR. The artificial lung that adds oxygen and removes carbon dioxide.

MENADIONE. A synthetic form of vitamin K. It is sometimes called vitamin K_3.

(c) 2011 Cengage Learning. All Rights Reserved.

MENARCHE. The first menstrual period in a human female, considered the central event of puberty in girls.

MENDELIAN INHERITANCE. An inheritance pattern for autosomal gene pairs. The genetic trait displayed results from one parent's gene dominating over the gene inherited from the other parent.

MENGHINI NEEDLE. A special needle used to obtain a sample of liver tissue.

MÉNIÈRE'S DISEASE. An abnormality of the inner ear that causes dizziness, ringing in the ears, and hearing loss.

MENINGES (SINGULAR, MENINX). The membranes that cover the brain and spinal cord.

MENINGITIS. An infection or inflammation of the membranes or tissues that cover the brain and spinal cord, caused by bacteria or a virus.

MENOPAUSE. The end of a woman's menstrual periods when a woman no longer can conceive a child.

MENORRHAGIA. Excessively heavy menstrual flow with cycles of normal length. It is also called hypermenorrhea.

MENTAL RETARDATION. Significant impairment in intellectual function and adaptation in society. Usually associated an intelligence quotient (IQ) below 70.

MEQ/L. Abbreviation for milliequivalents per liter. Some medical test results are reported in mEq/L.

MERCURIC CHLORIDE; MERCURY(II) CHLORIDE; $HGCL_2$. A poisonous crystalline form of inorganic mercury that is used as a disinfectant and fungicide.

MERIDIAN. In traditional Chinese medicine, the channels that run beneath the skin through which the body's energy flows.

MESENTERIC ADENITIS. Inflammation of the lymph nodes that serve the small intestine. Has symptoms similar to appendicitis.

MESOSALPINX. A ligament connected to the fallopian tube.

MESOTHELIUM. A membrane/sac that protects the body's major internal organs and allows them freedom of movement (for example, lung contractions). The mesothelium is comprised of several regions, including the abdominal cavity (peritoneum), the chest cavity (pleura), and pericardium (heart).

METABOLIC. Refers to the chemical reactions in living things.

METABOLIC ACTIVITY. The sum of the chemical processes in the body that are necessary to maintain life.

METABOLIC BONE DISEASE. Weakening of bones due to a deficiency of certain minerals, especially calcium.

METABOLIC EQUIVALENT OF TASK (MET). The energy cost of a physical activity, measured as a multiple of the resting metabolic rate, which is defined as 3.5 milliliters of oxygen consumed per kilogram (kg) of body weight per minute, equivalent to 1 kilocalorie per kg per hour.

METABOLIC FUNCTION. Those processes necessary for the maintenance of a living organism.

METABOLIC PATHWAY. A sequence of chemical reactions that lead from some precursor to a product, where the product of each step in the series is the starting material for the next step.

METABOLIC SYNDROME. A group of risk factors for heart disease, diabetes, and stroke. It includes abdominal obesity, high blood pressure, high blood glucose levels, and low levels of high-density lipoprotein (HDL) cholesterol. The metabolic syndrome is sometimes called the insulin resistance syndrome.

METABOLISM. All the physical and chemical changes that occur in cells to allow growth and maintain body functions. These include processes that break down substances to yield energy and processes that build up other substances necessary for life.

METABOLITES. Substances produced by metabolism or by a metabolic process.

METACERCARIA (PLURAL, METACERCARIAE). The encysted stage of a fluke larva that produces infection in human beings.

METASTASIS (PLURAL, METASTASES). A tumor growth or deposit that has spread via lymph or blood to an area of the body remote from the primary tumor.

METASTASIZE. Spread of cells from the original site of the cancer to other parts of the body where secondary tumors are formed.

METASTATIC. The term used to describe a secondary cancer, or one that has spread from one area of the body to another.

METASTATIC CANCER. A cancer that has spread to an organ or tissue from a primary cancer located elsewhere in the body.

(c) 2011 Cengage Learning. All Rights Reserved.

METHAMPHETAMINE (METH, METHADRINE, "SPEED"). A highly addictive medication that is widely abused as a stimulant.

METHEMOGLOBIN. A compound formed from hemoglobin by oxidation.

METHOTREXATE. A drug that interferes with cell growth and is used to treat rheumatoid arthritis as well as various types of cancer. Side effects may include mouth sores, digestive upsets, skin rashes, and hair loss.

METHYLATION TESTING. DNA testing that detects if a gene is active or imprinted.

METHYLENE BLUE. A dye that is used to stain the blood cells for the reticulocyte count.

METHYLMERCURY. Any of various toxic compounds containing the organic grouping CH_3Hg. These compounds occur as industrial byproducts and pesticide residues, accumulate in fish and other organisms—especially those high on the food chain, and are rapidly absorbed through the human intestine to cause neurological disorders such as Minamata disease.

METRONIDAZOLE. An anti-infective agent regarded as the best available drug for treating trichomoniasis. It is sold under the trade names Flagyl and MetroGel.

MIASM. In homeopathy, an inherited weakness or predisposition to disease.

MICROANGIOPATHIC. Pertaining to disorders of the small blood vessels.

MICROBE. A microorganism, especially a bacterium, that causes disease.

MICROCALCIFICATIONS. Tiny flecks that are too small to be felt. They are important markers of cancer that show up on ultrasound and mammogram.

MICROCEPHALY. An abnormally small head.

MICROCIRCULATION. The passage of blood in the smallest blood vessels of the body, such as the capillaries in the hand and fingers.

MICROCYTIC. A descriptive term applied to a smaller than normal red blood cell.

MICROEMBOLI. Small blot clots in the bloodstream.

MICROFILARIAE. The larvae and infective form of filarial worms.

MICROFLORA. The bacterial population in the intestine.

MICROKERATOME. A precision surgical instrument that can slice an extremely thin layer of tissue from the surface of the cornea.

MICRONUTRIENTS. Essential dietary elements that are needed only in very small quantities. Micronutrients are also known as trace elements. They include copper, zinc, selenium, iodine, magnesium, iron, cobalt, and chromium.

MICROORGANISMS. Microscopic organisms, such as bacteria, viruses, algae, and fungi.

MICROSPORIDA. A type of parasitic protozoa.

MICROSURGERY. Surgery on small body structures or cells performed with the aid of a microscope and other specialized instruments.

MICROTUBULES. Slender, elongated anatomical channels in worms.

MIDDLE EAR. The cavity or space between the eardrum and the inner ear. It includes the eardrum, the three little bones (hammer, anvil, and stirrup) that transmit sound to the inner ear, and the Eustachian tube, which connects the inner ear to the nasopharynx (the back of the nose).

MIGRAINE HEADACHE. An intense throbbing pain that occurs on one or both sides of the head. The headache is usually accompanied by other symptoms, such as nausea, vomiting, and aversion to light.

MIGRAINE NEURALGIA. A variant of migraine pain, also called cluster headache, in which severe attacks of pain affect the eye and forehead on one side of the face.

MILD COGNITIVE IMPAIRMENT (MCI). A transitional phase of memory loss in older people that precedes dementia or Alzheimer's disease.

MILIARY TUBERCULOSIS. The form of TB in which the bacillus spreads through all body tissues and organs, producing many thousands of tiny tubercular lesions. Miliary TB is often fatal unless promptly treated.

MILK-ALKALI SYNDROME. Elevated blood calcium levels and alkalosis caused by excessive intake of milk and alkalis. Usually occurs in the treatment of peptic ulcer.

MINERAL. An inorganic substance found in the earth that is necessary in small quantities for the body to maintain health. Examples: zinc, copper, iron.

MINERALIZATION. The process by which the body uses minerals to build bone structure.

(c) 2011 Cengage Learning. All Rights Reserved.

MINIGRAFT OR MICROGRAFT. Transplantation of a small number of hair follicles, as few as one to three hairs, into a transplant site.

MINIMUM ERYTHEMA DOSE. The minimum amount of ultraviolet B (UVB) light that produces redness 24 hours after exposure. It is the starting dose for UVB light treatments.

MINIMUM PHOTOTOXIC DOSE. The dose of ultraviolet A (UVA) light that produces uniform redness 72 hours after ingesting a psoralen compound. It becomes the starting dose for PUVA (psoralen + UVA) treatment.

MIOTIC. A drug that causes pupils to contract.

MIRACIDIUM (PLURAL, MIRACIDIA). The free-swimming larval form in the life cycle of the liver fluke.

MISCARRIAGE. The spontaneous end of a pregnancy before the twentieth week. The death of the fetus is a common cause of miscarriage.

MISPROSTOL. A drug used in combination with mifepristone to cause uterine contractions that expel the contents of the uterus.

MITE. An insect parasite belonging to the order Acarina.

MITOCHONDRIA. Spherical or rod-shaped parts of the cell. Mitochondria contain genetic material (DNA and RNA) and are responsible for converting food to energy.

MITRAL STENOSIS. Narrowing or constricting of the mitral valve, which separates the left atrium from the left ventricle.

MITRAL VALVE. The heart valve that prevents blood from flowing backwards from the left ventricle into the left atrium. Also known as bicuspid valve.

MITRAL VALVE LEAFLETS. The mitral valve is made up of two valve leaflets (the anteromedial leaflet and the posterolateral leaflet) and a ring around the valve, known as the mitral valve annulus. The orientation of the two leaflets resembles a bishop's miter, which is where the valve received its name.

MITRAL VALVE PROLAPSE. A heart defect in which one of the valves of the heart (which normally controls blood flow) becomes floppy. Mitral valve prolapse may be detected as a heart murmur but there are usually no symptoms.

MIXED MANIA. A mental state in which symptoms of both depression and mania occur simultaneously.

MOBILIZATION. Making movable; restoring the power of motion in a joint; movement that increases joint mobility.

MODALITIES. The factors and circumstances that cause a patient's symptoms to improve or worsen.

MOHS' MICROGRAPHIC SURGERY. A surgical technique in which successive rings of skin tissue are removed and examined under a microscope to ensure that no cancer is left.

MOLARS. The teeth behind the primary canines or permanent premolars, with large crowns and broad chewing surfaces for grinding food.

MOLLUSCUM CONTAGIOSUM. A disease of the skin and mucuous membranes, caused by a poxvirus and found all over the world.

MONOAMINE OXIDASE INHIBITOR (MAOI). An older class of antidepressants.

MONOCHORIONIC TWINS. Twins that share a single placenta.

MONOCLONAL. Identical cells or proteins; cells (clones) derived from a single, genetically distinct cell, or proteins produced by these cells.

MONOCLONAL ANTIBODY. A protein substance that is produced in the laboratory by a single population of cells; used in cancer immunotherapy treatment.

MONOCLONAL GAMMOPATHY OF UNDETERMINED SIGNIFICANCE (MGUS). Common condition in which M-protein is present, but there are no tumors or other symptoms of disease.

MONOCYTE. White blood cell that increases during a variety of conditions including severe infections. It removes debris and microorganisms by the cellular process phagocytosis.

MONONUCLEAR PHAGOCYTE. A type of cell of the human immune system that ingests bacteria, viruses, and other foreign matter, thus removing potentially harmful substances from the bloodstream. These substances are usually then digested within the phagocyte.

MONONUCLEOSIS. An infection that causes swelling of lymph nodes, spleen, and liver, usually accompanied by extremely sore throat, fever, headache, and intense long-lasting fatigue.

MONOSACCHARIDE. The simplest form of sugar. Monosaccharides combine to form disaccharides and such complex carbohydrates as starch and cellulose.

(c) 2011 Cengage Learning. All Rights Reserved.

MONOUNSATURATED FAT. Fats that contain one double or triple bond per molecule; examples include canola oil and olive oil.

MONS PUBIS. The fatty tissue over the area where the pubic bones meet.

MONSEL'S SOLUTION. A solution used to stop bleeding.

MONTELUKAST (SINGULAIR). An inhibitor that prevents leukotrienes from binding to cell receptors; taken over time, montelukast can reduce or prevent symptoms of asthma and allergies.

MOOD DISORDER. A group of mental disorders involving a disturbance of mood, along with either a full or partial excessively happy (manic) or extremely sad (depressive) syndrome not caused by any other physical or mental disorder. Mood refers to a prolonged emotion.

MORBIDITY. Morbidity refers to an illness or disease condition. In statistics it refers to the rate at which a disease occurs.

MORBIDLY OBESE. Definition of a person who is 100 lb (45 kg) or more than 50% overweight and has a body mass index above 40.

MORO REFLEX. A reflex startle reaction in infants: the arms and legs move away from the body and to the side and are then drawn together.

MORPHEA. The most common form of localized scleroderma.

MORPHINE. Morphine is the naturally occurring opioid in the opium poppy, *Papaver somniferum*. It is a powerful narcotic analgesic, and its primary clinical use is in the management of moderately severe to severe pain. After heroin, morphine has the greatest potential for addiction of all narcotic analgesics.

MORPHOLOGY. Literally, the study of form. In medicine, morphology refers to the size, shape, and structure rather than the function of a given organ.

MORTALITY. Mortality means death. In statistics it refers to the rate at which death occurs in a population for a particular disease condition.

MOSAIC. A term referring to a genetic situation in which an individual's cells do not have the exact same composition of chromosomes—for example, in Down syndrome, some of the individual's cells may have a normal 46 chromosomes, while other cells have an abnormal 47 chromosomes.

MOSAICISM. A genetic condition resulting from a mutation, crossing over, or nondisjunction of chromosomes during cell division, causing a variation in the number of chromosomes in the cells.

MOTHER TINCTURE. The first stage in the preparation of a homeopathic remedy, made by soaking a plant, animal, or mineral product in a solution of alcohol.

MOTILITY. The movement or capacity for movement of an organism or body organ.

MOTION SICKNESS. Also called kinetosis; nausea and possibly vomiting induced by motion, such as travel by car, boat, or plane.

MOTOR. Of or pertaining to motion, the body apparatus involved in movement, or the brain functions that direct purposeful activity.

MOTOR NERVE. Motor or efferent nerve cells carry impulses from the brain to muscle or organ tissue.

MOTOR NEURON. Nerve cells within the central nervous system that carry nerve impulses controlling muscle movement.

MOTOR SKILL LEARNING. Memory system associated with physical movement and activity. For example, learning to swim is initially difficult, but once an efficient stroke is learned, it requires little conscious effort.

MOTOR SKILLS. Controlled movement of muscle groups. Fine motor skills involve tasks that require dexterity of small muscles, such as buttoning a shirt. Tasks such as walking or throwing a ball involve the use of gross motor skills.

MOTOR UNIT ACTION POTENTIALS. Spikes of electrical activity recorded during an EMG that reflect the number of motor units (motor neurons and the muscle fibers they transmit signals to) activated when the patient voluntarily contracts a muscle.

MOURNING. The public expression of bereavement; it may include funerals and other rituals, special clothing, and symbolic gestures.

MOUSSE OIL. Crude oil that has emulsified or weathered, mixed with dispersants, water, and marine material to form a spongy, light brown, mousse-like material.

MOXIBUSTION. An acupuncture technique that burns the herb moxa or mugwort.

MUCIN. A protein in saliva that combines with sugars in the mouth to form plaque.

(c) 2011 Cengage Learning. All Rights Reserved.

MUCINOUS (COLLOID) CARCINOMA. A type of cancer that accounts for 1% to 2% of breast cancers. Resembles medullary carcinoma in ultrasound and mammogram, but usually affects older women.

MUCOCILIARY ESCALATOR. The coordinated action of tiny projections on the surfaces of cells lining the respiratory tract, which moves mucus up and out of the lungs.

MUCOCUTANEOUS LYMPH NODE SYNDROME (MLNS). Another name for Kawasaki syndrome. The name comes from the key symptoms of the disease, which involve the mucous membranes of the mouth and throat, the skin, and the lymph nodes.

MUCOLYTIC. An agent that dissolves or destroys mucin, the chief component of mucus.

MUCOPOLYSACCHARIDE. A complex molecule made of smaller sugar molecules strung together to form a chain. Found in mucous secretions and intercellular spaces.

MUCOSA. The mucous membrane, or the thin layer that lines body cavities and passages.

MUCOSAL. Refers to tissues that produce mucus, such as the digestive, genital, and urinary tracts.

MUCOUS MEMBRANES. The moist coverings that line the mouth, nose, intestines, and other internal organs.

MUCUS. Thick fluid produced by the moist membranes that line many body cavities and structures.

MULTIDRUG–RESISTANT ORGANISMS (MDROS). Bacteria that are resistant to one or more classes of antimicrobial agents and usually are resistant to all but one or two commercially available antimicrobial agents.

MULTI-FETAL PREGNANCY. A pregnancy of two or more fetuses.

MULTIFOCAL. Having many focal points; occuring at multiple sites.

MULTI-INFARCT DEMENTIA. Dementia caused by damage to brain tissue resulting from a series of blood clots or clogs in the blood vessels. It is also called vascular dementia.

MULTINODULAR GOITER. A condition in which benign lumps of tissue (nodules) form within the thyroid gland and cause it to secrete too much thyroid hormone. It is also called Plummer's disease.

MULTIPLE CHEMICAL SENSITIVITY. A condition characterized by severe and crippling allergic reactions to commonly used substances, particularly chemicals. Also called environmental illness.

MULTIPLE ENDOCRINE NEOPLASIA. Abnormal tissue growth on one or more of the endocrine (hormone-secreting) glands.

MULTIPLE ENDOCRINE NEOPLASIA TYPE 1 (MEN-1). An inherited condition marked by multiple malignancies of the pituitary gland, parathyroid gland, and islet cells of the pancreas. About half of MEN-1 patients with pancreatic islet cell tumors will have gastrinomas, gastrin-producing tumors that lead to ulcer disease.

MULTIPLE MYELOMA. Cancer of the plasma cells.

MULTIPLE PERSONALITY DISORDER (MPD). An older term for dissociative identity disorder (DID).

MULTIPLE SCLEROSIS. A degenerative nervous system disorder in which the protective covering of the nerves in the brain are damaged, leading to tremor and paralysis.

MULTITASKING. Performing multiple duties or taking on multiple responsibilities and roles simultaneously.

MUMPS. An acute and highly contagious viral illness that usually occurs in childhood.

MUNCHAUSEN BY PROXY. A factitious diagnosis in children produced by a parent or other caregiver.

MUNCHAUSEN SYNDROME. A factitious self-diagnosis in which the patient's symptoms are dramatized and exaggerated.

MURMUR. An abnormal heart sound that can reflect a valve dysfunction.

MUSCLE DYSMORPHIA. A subtype of body dysmorphic disorder, described as excessive preoccupation with muscularity and body building to the point of interference with social, educational, or occupational functioning.

MUSCLE TONE. Also termed tonus; the normal state of balanced tension in the tissues of the body, especially the muscles.

MUSCULAR DYSTROPHY. A group of inherited diseases characterized by progressive wasting of the muscles.

MUTATE. Undergo a spontaneous change in the makeup of genes or chromosomes.

MUTATION. A permanent change in the genetic material that may alter a trait or characteristic of an individual, or manifest as disease, and can be transmitted to offspring.

(c) 2011 Cengage Learning. All Rights Reserved.

MUTISM. The inability or refusal to speak.

MYALGIA. Muscular pain or tenderness, typically of a diffuse and/or nonspecific nature.

MYALGIC ENCEPHALOMYELITIS. An older name for chronic fatigue syndrome; encephalomyelitis refers to inflammation of the brain and spinal cord.

MYASTHENIA GRAVIS. A muscle weakness that occurs because the body makes antibodies to the natural chemical that facilitates transmission of impulses between the nerve and the muscle.

MYCOBACTERIA. A group of bacteria that includes *Mycobacterium tuberculosis*, the bacterium that causes tuberculosis, and other forms that cause related illnesses.

MYCOPLASMA. A type of free-living microorganism that has no cell wall. Mycoplasmas cause some varieties of pneumonia and urinary tract infections that stimulate the body to produce cold agglutinins.

MYCOPLASMA PNEUMONIA. An incomplete bacterium that infects the lung.

MYCOSIS FUNGOIDES. The most common type of cutaneous T-cell lymphoma. This low-grade lymphoma primarily affects the skin. Generally, it has a slow course and often remains confined to the skin. In about 10% of cases, it can progress to the lymph nodes and internal organs.

MYDRIATIC. Causing dilation or widening of the pupil of the eye.

MYELIN. A protective cover that surrounds nerve cells and helps to increase the speed by which information travels along the nerve; also referred to as myelin sheath.

MYELODYSPLASIA. Also called myelodysplastic syndrome, it is a condition in which the bone marrow does not function normally and can affect the various types of blood cells produced in the bone marrow. Often referred to as a preleukemia and may progress and become acute leukemia.

MYELOFIBROSIS. An anemic condition in which bone marrow cells are abnormal or defective and become fibrotic.

MYELOGRAM. A special type of x-ray study of the spinal cord, made after a contrast medium has been injected into the space surrounding the cord.

MYELOGRAPHY. An imaging procedure involving the injection of a radioactive dye into the fluid surrounding the spine. A myelography can be used to detect herniated disks, nerve root damage, and other problems affecting the cervical spine.

MYELOMA. A tumor of plasma cells that originates in bone marrow and usually spreads to more than one bone.

MYELOMENINGOCELES (MMC). A protrusion in the vertebral column containing spinal cord and meninges.

MYELOPATHY. A disorder in which the tissue of the spinal cord is diseased or damaged.

MYELOPROLIFERATIVE DISORDER. A disorder in which the bone marrow produces too many cells too rapidly.

MYELOSUPPRESSIVE THERAPY. Any form of treatment that is aimed at slowing down the rate of blood cell production.

MYOCARDIAL INFARCTION. Commonly known as a heart attack, a myocardial infarction is an episode in which some of the heart's blood supply is severely cut off or restricted, causing the heart muscle to suffer and die from lack of oxygen.

MYOCARDITIS. Inflammation of the heart tissue.

MYOCARDIUM. The medical term for the specialized involuntary muscle tissue found in the walls of the heart.

MYOCLONIC. A rapid, involuntary muscle contraction, particularly near the eye.

MYOCLONUS. Involuntary contractions of a muscle or group of muscles.

MYOFASCIAL. The fibrous tissue that encloses and separates layers of muscles.

MYOGLOBIN. A protein that holds oxygen in heart and skeletal muscle. It rises after damage to either of these muscle types.

MYOGLOBINURIA. Reddish urine caused by excretion of myoglobin, a breakdown product of muscle.

MYOMA. Benign (noncancerous) tumors of the uterus.

MYONECROSIS. The destruction or death of muscle tissue.

MYOPATHY. A disorder that causes weakening of muscles.

MYOPIA. A vision problem in which distant objects appear blurry. Myopia results when the cornea is too steep or the eye is too long and the light doesn't focus properly on the retina. People who are myopic or

(c) 2011 Cengage Learning. All Rights Reserved.

nearsighted can usually see near objects clearly, but not far objects.

MYOTONIC DYSTROPHY. A form of muscular dystrophy, also known as Steinert's condition, characterized by delay in the ability to relax muscles after forceful contraction, wasting of muscles, and other abnormalities.

MYRINGOTOMY. Surgical cutting of the eardrum to allow fluid to escape from the middle ear.

MYXEDEMA. Hypothyroidism, characterized by thick, puffy features; an enlarged tongue; and lack of emotion.

N

NAIL BED. The layer of tissue underneath the nail.

NALTREXONE. A medication originally developed to treat addiction to heroin or morphine that is also used to treat alcoholism. It works by reducing the craving for alcohol rather than by producing vomiting or other unpleasant reactions.

NANOMETER. A measurement of length equal to 10^{-9} meters, or one billionth of a meter. It is used as a unit of measurement for light waves.

NARCOLEPSY. A lifelong sleep disorder marked by four symptoms: sudden brief sleep attacks, cataplexy, temporary paralysis, and hallucinations. The hallucinations are associated with falling asleep or the transition from sleeping to waking.

NARCOTIC. A drug derived from opium or compounds similar to opium. Such drugs are potent pain relievers and can affect mood and behavior. Long-term use of narcotics can lead to dependence and tolerance.

NASAL POLYPS. Drop-shaped overgrowths of the nasal membranes.

NASAL SCRAPING. Pathological material obtained for clinical study by scratching the inner surface of the nose with a clinical instrument.

NASAL SEPTUM. The membrane that separates the nostrils.

NASOGASTRIC TUBE. A tube placed through the nose into the stomach.

NASOLACRIMAL DUCT. A channel that transmits tears from the lacrimal sac to the nose.

NASOPHARYNGEAL. Referring to the passage connecting the nasal cavity behind the nose to the top of the throat behind the soft palate.

NASOPHARYNGOSCOPY. A diagnostic procedure that examines the nasal passageways and pharynx with an instrument outfitted with an optical system.

NASOPHARYNX. The passage that connects the nasal cavity to the top of the throat.

NATURAL KILLER (NK) CELL. A lymphocyte that acts as a primary immune defense against infection.

NATUROPATHIC PHYSICIANS. Physicians specializing in the treatment of disease using a variety of natural methods and plant-based medicines.

NAUSEA. Stomach distress characterized by a distaste for food and the urge to vomit.

NEARSIGHTEDNESS. A condition in which one or both eyes cannot focus normally, causing objects at a distance to appear blurred and indistinct. Also called myopia.

NEBULIZER. A device that turns liquid forms of medicine into a fine spray that can be inhaled.

NECROSIS. The death of cells, a portion of tissue, or a portion of an organ due to permanent damage of some sort, such as a lack of oxygen supply to the tissues.

NECROTIZING ENTEROCOLITIS (NEC). A condition in which part of the intestines are destroyed as a result of bacterial infection.

NECROTIZING FASCIITIS. A destructive infection which follows severe cellulitis and involves the deep skin and underlying tissues.

NECROTIZING PNEUMONIA. Pneumonia that causes the death of lung tissue. It often precedes the development of lung abscess.

NEEDLE BIOPSY. The procedure of using a large hollow needle to obtain a sample of intact tissue.

NEGATIVE SYMPTOMS. Symptoms of schizophrenia characterized by the absence or elimination of certain behaviors. DSM–IV specifies three negative symptoms: affective flattening, poverty of speech, and loss of will or initiative.

NEGATIVISM. Behavior characterized by resistance, opposition, and refusal to cooperate with requests, even the most reasonable ones.

NEISSERIA GONORRHOEAE. The bacterium that causes gonorrhea.

(c) 2011 Cengage Learning. All Rights Reserved.

NEMATODE. A type of roundworm with a long, unsegmented body, usually parasitic on animals or plants.

NEOADJUVANT THERAPY. Radiation therapy or chemotherapy used to shrink a tumor before surgical removal of the tumor.

NEONATAL. Referring to the period shortly after birth.

NEONATAL JAUNDICE. A disorder in newborns where the liver is too premature to conjugate bilirubin, which builds up in the blood.

NEONATE. A term referring to the newborn infant, from birth until one month of age.

NEONATOLOGIST. A physician who specializes in problems of newborn infants.

NEOPLASIA. Abnormal growth of cells, which may lead to a neoplasm, or tumor.

NEOPLASM. An uncontrolled growth of new tissue (a tumor).

NEOVASCULARIZATION. Abnormal or excessive formation of blood vessels as in some retinal disorders.

NEPHRECTOMY. A medical procedure in which the kidney is surgically removed.

NEPHRITIS. Inflammation of the kidneys.

NEPHROLOGIST. A doctor who specializes in the diseases and disorders of the kidneys.

NEPHRON. The basic structural unit of the kidney, responsible for regulating the concentration of water and soluble chemicals in the blood by filtering the blood, reabsorbing the compounds needed by the body, and excreting the rest in the urine. Each kidney in humans contains between 800,000 and one million nephrons.

NEPHROSCOPE. An instrument made of a light source in a tube. The tube is inserted into the kidney through an incision in the back and used to locate kidney stones. The stones are broken up with high frequency sound waves and removed by suction through the scope.

NEPHROSIS. Any degenerative disease of the kidney (not to be confused with nephritis, an inflammation of the kidney due to bacteria).

NEPHROTIC SYNDROME. A condition characterized by water retention, little or no protein in urine, and high blood cholesterol.

NEPHROTOXIC. Toxic, or damaging, to the kidney.

NEPHROTOXIN. Substance that is poisonous to the kidneys.

NERVE BIOPSY. A medical test in which a small portion of a damaged nerve is surgically removed and examined under a microscope.

NERVE CONDUCTION. The speed and strength of a signal being transmitted by nerve cells.

NERVE CONDUCTION TESTING; NERVE CONDUCTION VELOCITY TEST. Procedure that measures the speed at which impulses move through the nerves after electrical stimulation.

NERVE GROWTH FACTOR. A protein resembling insulin that affects growth and maintenance of nerve cells.

NERVOUS SYSTEM. The complete network of the body's nerves, sense organs, and brain.

NERVOUS TIC. A repetitive, involuntary action, such as the twitching of a muscle or repeated blinking.

NEUCHAL TRANSLUCENCY. A pocket of fluid at the back of an embryo's neck visible via ultrasound that, when thickened, may indicate the infant will be born with a congenital heart defect.

NEURAL TUBE DEFECTS (NTDS). A group of birth defects that affect the brain and spinal cord.

NEURALGIA. Pain extending along one or more nerves.

NEURALLY MEDIATED HYPOTENSION. A rapid fall in blood pressure that causes dizziness, blurred vision, and fainting, often followed by prolonged fatigue.

NEURASTHENIA. A term coined in the late nineteenth century to refer to a condition of chronic mental and physical weakness and fatigue.

NEURITIS. An inflammation of the nerves.

NEUROBLAST. An embryonic nerve cell that differentiates into a neuron.

NEUROBLAST CELLS. Cells produced by the fetus that mature into nerve cells and adrenal medulla cells.

NEUROBLASTOMA. Neuroblastoma is a tumor of the adrenal glands or sympathetic nervous system. Neuroblastomas can range from being relatively harmless to highly malignant.

NEUROCYSTICERCOSIS. Parasitic infection caused by the presence of immature tapeworm larvae within the central nervous system.

(c) 2011 Cengage Learning. All Rights Reserved.

NEURODEGENERATIVE. Relating to degeneration of nerve tissues.

NEURODEGENERATIVE DISEASE. A disease in which the nervous system progressively and irreversibly deteriorates.

NEURODERMATITIS. An itchy skin disease (also called lichen simplex chronicus) found in nervous, anxious people.

NEUROFIBRILLARY TANGLES. Accumulations of twisted protein fragments inside nerve cells in the brain that are diagnostic of Alzheimer's disease.

NEUROFIBROMA. A soft tumor usually located on a nerve.

NEUROFIBROMATOSIS. A rare hereditary disease that involves the growth of lesions that may affect the spinal cord.

NEUROFIBROMATOSIS TYPE 2 (NF2). A hereditary condition associated with an increased risk of bilateral acoustic neuromas, other nerve cell tumors, and cataracts.

NEUROGENIC. Caused by nerves; originating in the nerves.

NEUROLEPTICS. Antipsychotic drugs, including major tranquilizers, used in the treatment of psychoses like schizophrenia.

NEUROLOGIC. Pertaining to the nervous system.

NEUROLOGICAL CONDITIONS. A condition that has its origin in some part of the patient's nervous system.

NEUROLOGICAL SYSTEM. The tissue that initiates and transmits nerve impulses, including the brain, spinal cord, and nerves.

NEUROLOGIST. A doctor who specializes in disorders of the brain and central nervous system.

NEUROMUSCULAR. Relating to nerves and muscles or their interaction.

NEUROMUSCULAR JUNCTION. The site at which nerve impulses are transmitted to muscles.

NEURON. A unique type of cell found in the brain and body that is specialized to process and transmit information.

NEUROPATHY. A condition affecting the nerves supplying the arms and legs. Typically, the feet and hands are involved first. If sensory nerves are involved, numbness, tingling, and pain are prominent, and if motor nerves are involved, the patient experiences weakness.

NEUROPROTECTIVE. Conveying some form of protection to the nervous system from injury.

NEUROPSYCHOLOGICAL TEST. A test or assessment given to diagnose or evaluate a brain disorder, disease, or injury.

NEUROPSYCHOLOGIST. A clinical psychologist who specializes in assessing psychological status caused by a brain disorder.

NEUROSYPHILIS. Syphilis of the central nervous system.

NEUROTIC. Behavior characterized by neurosis, mental functional orders with symptoms such as anxiety, depression, compulsions, and phobias.

NEUROTOXIN. A substance that damages, destroys, or impairs the functioning of nerve tissue.

NEUROTRANSMISSION. When a neurotransmitter, or chemical agent released by a particular brain cell, travels across the synapse to act on the target cell to either inhibit or excite it.

NEUROTRANSMITTER. One of a group of chemicals secreted by a nerve cell (neuron) to carry a chemical message to another nerve cell, often as a way of transmitting a nerve impulse. Examples of neurotransmitters include acetylcholine, dopamine, serotonin, and norepinephrine.

NEUTROPHIL. The primary type of white blood cell involved in inflammation. Neutrophils are a type of granulocyte, also known as a polymorphonuclear leukocyte.

NEVUS (PLURAL, NEVI). The medical term for any anomaly of the skin that is present at birth, including moles and birthmarks.

NIACINAMIDE. A form of niacin that is usually used as a dietary supplement for people with insufficient niacin.

NICOTINE. A colorless, oily chemical found in tobacco that makes people physically dependent on smoking. It is poisonous in large doses.

NICOTINE REPLACEMENT THERAPY. A method of weaning a smoker away from the habit by giving the smoker smaller and smaller doses of nicotine over time.

NIGHT GUARD. A removable, custom-fitted plastic appliance that fits between the upper and lower teeth to prevent them from grinding against each other.

(c) 2011 Cengage Learning. All Rights Reserved.

NIMODIPINE (NIMOTOP). A calcium-channel blocker; a drug that relaxes arterial smooth muscle by slowing the movement of calcium across cell walls.

NIT. The egg sac laid by adult female lice.

NITROGEN NARCOSIS. Also called "rapture of the deep," the condition is caused by increased nitrogen pressure at depth and is characterized by symptoms similar to alcohol intoxication.

NITROPRUSSIDE. A compound that is used in laboratory tests to identify large amounts of cystine in urine samples.

NITROUS OXIDE. A colorless, sweet-smelling gas used by dentists for mild anesthesia. It is sometimes called laughing gas because it makes some patients feel giddy or silly.

NOCICEPTOR. A nerve cell that is capable of sensing pain and transmitting a pain signal.

NOCTURIA. Excessive need to urinate at night.

NOCTURNAL ENURESIS. The medical term for bedwetting.

NOCTURNAL MYOCLONUS. A disorder in which the patient is awakened repeatedly during the night by cramps or twitches in the calf muscles. Nocturnal myoclonus is sometimes called periodic limb movement disorder (PLMD).

NODULAR GOITER. An enlargement of the thyroid (goiter) caused when groups of cells collect to form nodules.

NODULES. A small mass of tissue in the form of a protuberance or a knot that is solid and can be detected by touch.

NONDISJUNCTION. Non-separation of a chromosome pair, during either meiosis or mitosis.

NON-HODGKIN'S LYMPHOMA. Cancer that originates in the lymphatic system and typically spreads throughout the body.

NONINVASIVE. A procedure that does not penetrate the body.

NON-IONIZING RADIATION. Rays of energy that move in long, slow wave patterns and do not penetrate cells.

NONMELANOMA SKIN CANCER. A squamous cell carcinoma or basal cell carcinoma.

NON-MYELOABLATIVE ALLOGENEIC BONE MARROW TRANSPLANT. Also called "mini" bone marrow transplants, this type of transplant involves receiving low-doses of chemotherapy and radiation therapy, followed by the infusion of a donor's bone marrow or peripheral stem cells. The goal is to suppress the patient's own bone marrow to allow the donor's cells to engraft.

NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS. A class of antiretroviral drugs that work by inhibiting the reverse transcriptase enzyme necessary for HIV replication.

NONOXYNOL-9. The chemical name of the organic compound most commonly used in contraceptive creams, foams, and jellies. It was also used in the manufacture of spermicide-treated condoms until 2005, but the use of such condoms is now discouraged.

NONPALPABLE. Cannot be felt by hand.

NONPHARMACOLOGICAL. Referring to therapy that does not involve drugs.

NONPROLIFERATIVE RETINOPATHY. Retinopathy without the growth of new blood vessels.

NON-RAPID EYE MOVEMENT (NREM) SLEEP. A type of sleep that differs from rapid eye movement (REM) sleep. The four stages of NREM sleep account for 75%–80% of total sleeping time.

NONSPHEROCYTIC. Not sphere-shaped.

NONSPHEROCYTIC HEMOLYTIC ANEMIA. Anemia caused by variably shaped red blood cells that burst, or hemolyze, easily.

NONSTEROIDAL. Not containing steroids or cortisone.

NONSTEROIDAL ANTI-INFLAMMATORY DRUGS (NSAIDS). A class of drugs that is used to relieve pain and symptoms of inflammation, such as ibuprofen and aspirin.

NON-STRESS TEST. A record of the fetal heart rate in the absence of contractions (stress).

NONVERBAL LEARNING DISABILITY (NLD). A learning disability syndrome identified in 1989 that may overlap with some of the symptoms of Asperger syndrome.

NOREPINEPHRINE. A hormone released by nerve cells and the adrenal medulla that causes constriction of blood vessels. Norepinephrine also functions as a neurotransmitter.

NORMAL FLORA. The mixture of bacteria normally found at specific body sites.

(c) 2011 Cengage Learning. All Rights Reserved.

NORMAL WEIGHT. A BMI of between 18.5 and 24.9.

NORMOCHROMIC. A descriptive term applied to a red blood cell with a normal concentration of hemoglobin.

NORMOCYTIC. A descriptive term applied to a red blood cell of normal size.

NORMS. Normative or mean score for a particular age group.

NOSOCOMIAL. Contracted in a hospital; nosocomial infections are infections acquired by a patient while in the hospital.

NOSODE. A homeopathic remedy made from microbes, pus, or other disease material.

NOTCHING. A deformity of the surface of the ribs that is often associated with coarctation of the aorta.

NPO. A term that means "nothing by mouth." NPO refers to the time after which a patient is not allowed to eat or drink prior to a procedure or treatment.

NUCHAL CORD. The term used when the umbilical cord is looped around the fetus's neck in utero.

NUCHAL CYSTS. Small cysts in the fetus's neck that present in 1% of pregnancies.

NUCLEAR FAMILY. The basic family unit, consisting of father, mother, and their biological children.

NUCLEAR MEDICINE. A branch of medicine that makes use of radioisotopes (also called radionuclides) to evaluate the rate of radioactive decay in diagnosing and treating various diseases.

NUCLEAR SCANNING. Use of injected radioactive elements to analyze blood flow.

NUCLEIC ACID AMPLIFICATION TEST (NAAT). A screening test for gonorrhea that detects bacterial DNA in a urine sample or cervical swab.

NUCLEIC ACIDS. The cellular molecules DNA and RNA that act as coded instructions for the production of proteins and are copied for transmission of inherited traits.

NUCLEOSIDE ANALOGUES. The first group of effective antiretroviral medications. They work by interfering with the AIDS virus's synthesis of DNA.

NUCLEOTIDE. Any of a group of organic molecules that link together to form the building blocks of DNA or RNA.

NUCLEUS PULPOSUS (NP). An elastic, pulpy mass in the center of each vertebral disk.

NULLIPARITY. The condition of being nulliparous, or not bearing offspring.

NUMBNESS. Loss of feeling or sensation.

NUTRIENT. A food substance that provides energy or is necessary for growth and repair. Examples of nutrients are vitamins, minerals, carbohydrates, fats, and proteins.

NYMPH. The immature louse that hatches from the nit.

NYSTAGMUS. An involuntary back-and-forth movement of the eyes that is often found in albinism.

O

OBESITY. Excessive weight due to accumulation of fat, usually defined as a body mass index (BMI) of 30 or above or body weight greater than 30% above normal on standard height-weight tables.

OBSESSION. A repetitive or persistent thought, idea, or impulse that is perceived as inappropriate and distressing.

OBSESSIVE-COMPULSIVE DISORDER. An anxiety disorder in which people cannot prevent themselves from dwelling on unwanted thoughts, acting on urges, or performing repetitious rituals, such as washing their hands or checking to make sure they turned off the lights.

OBSTRUCTION. A blockage that prevents movement.

OBSTRUCTIVE SLEEP APNEA (OSA). A potentially life-threatening condition characterized by episodes of breathing cessation during sleep alternating with snoring or disordered breathing. The low levels of oxygen in the blood of patients with OSA may eventually cause heart problems or stroke.

OCCIPITAL NEURALGIA. Pain on one side of the back of the head caused by entrapment or pinching of an occipital nerve.

OCCLUSION. The way upper and lower teeth fit together during biting and chewing.

OCCLUSION THERAPY. A type of treatment for amblyopia in which the good eye is patched for a period of time. This forces the weaker eye to be used.

OCCLUSIVE. Closing off; blocking.

OCCULT. Not visible or easily detected.

(c) 2011 Cengage Learning. All Rights Reserved.

OCCULT BLOOD. Presence of blood that cannot be seen with the naked eye.

OCHRONOSIS. People with this rare hereditary condition tend to develop arthritis in adulthood.

OCULAR FUNDUS. The part of the eye opposite the pupil.

OCULAR LARVA MIGRANS (OLM). A syndrome associated with toxocariasis, in which the eye is invaded by migrating larvae.

OCULAR MELANOMA. A malignant tumor that arises within the structures of the eye. It is the most common eye tumor in adults.

OCULAR NEOVASCULARIZATION. Abnormal or excessive formation of blood vessels in the eye.

OCULOPHARYNGEAL MUSCULAR DYSTROPHY (OPMD). Form of muscular dystrophy affecting adults of both sexes, and causing weakness in the eye muscles and throat.

ODYNOPHAGIA. Pain felt when swallowing.

OFF-LABEL USE. The use of a prescription medication to treat conditions outside the indications approved by the U.S. Food and Drug Administration (FDA). It is legal for physicians to administer drugs for off-label uses, but it is not legal for pharmaceutical companies to advertise drugs for off-label uses.

OINTMENT. A thick substance that contains medicine and is meant to be spread on the skin, or if an ophthalmic ointment, in the eye.

OMEGA-3 FATTY ACIDS. A class of fatty acids that lowers the level of cholesterol in the blood. Omega-3 fatty acids are also essential for the growth and development of the brain and nerve tissue.

OMPHALOCELE. A congenital hernia in which a small portion of the fetal abdominal contents, covered by a membrane sac, protrudes into the base of the umbilical cord.

ONCHOCERCIASIS. Parasitic infestation caused by filamentous worms of the genus Onchocerca, especially *Onchocerca volvulus*, that is found in tropical America and is transmitted by several types of blackflies.

ONCOGENE. A gene that causes normal cell growth, but if mutated or expressed at high levels, encourages normal cells to change into cancerous cells.

ONCOLOGIST. A doctor who specializes in the treatment of cancer.

ONYCHOLYSIS. The separation of a nail from its underlying bed. Onycholysis is a common symptom of candidal infections of the nail or of exposure to harsh chemicals and detergents.

OOCYST. The egg form of the toxoplasmosis organism.

OOPHORECTOMY. Surgical removal of the ovaries; often performed laparoscopically.

OPACITY. An opaque spot in a normally transparent structure, such as the lens of the eye.

OPEN BITE. A malocclusion in which some teeth do not meet the opposing teeth.

OPHTHALMIA. Inflammation of the eye, usually severe and affecting the conjunctiva.

OPHTHALMIA NEONATORUM. The medical term for conjunctivitis in newborns.

OPHTHALMIC. Pertaining to the eye.

OPHTHALMIC ARTERY. The artery supplying the eye and adjacent structures with blood.

OPHTHALMOLOGIST. A physician specializing in the medical and surgical treatment of eye disorders.

OPHTHALMOLOGY. The branch of medicine that deals with the diagnosis and treatment of eye disorders.

OPHTHALMOSCOPE. An instrument routinely used by ophthalmologists to examine the interior of the eye. It consists of a small light, a mirror, and lenses of differing powers that magnify.

OPIATE. A drug containing or derived from opium—such as codeine, morphine, and heroin—that alleviates pain and induces sleep.

OPIATE BLOCKERS. A type of drug that blocks the effects of natural opiates in the system. This makes some people, including some people with autism, appear more responsive to their environment.

OPIOID. Any morphine-like synthetic narcotic that produces the same effects as drugs derived from the opium poppy (opiates), such as pain relief, sedation, constipation, and respiratory depression.

OPIOID RECEPTORS. Receptors located in the brain and various organs that bind opiates or opioid substances.

OPPORTUNISTIC INFECTION. An infection that is normally mild in a healthy individual, but that takes advantage of an ill person's weakened immune system to move into the body, grow, spread, and cause serious illness.

(c) 2011 Cengage Learning. All Rights Reserved.

OPPOSITIONAL DEFIANT DISORDER. A childhood behavioral disorder characterized by an ongoing pattern of disobedient, hostile, and defiant behavior toward authority figures that goes beyond the bounds of normal childhood conduct.

OPTIC ATROPHY. Degeneration of the optic nerve.

OPTIC DISK. The small area in the retina where the optic nerve enters the eye that is not sensitive to light. Also called the blind spot.

OPTIC NERVE. The nerve that carries visual messages from the retina to the brain.

OPTIC NEURITIS. Inflammation of the optic nerve that connects to the retina of the eye. This variable condition can present with any of the following symptoms: blurred vision, loss of visual acuity, loss of some or all color vision, complete or partial blindness, and pain behind the eye.

OPTOKINETIC. A reflex that causes a person's eyes to move when his or her field of vision moves.

OPTOMETRIST. A medical professional who examines and tests the eyes for disease and treats visual disorders by prescribing corrective lenses and/or vision therapy. In many states, optometrists are licensed to use diagnostic and therapeutic drugs to treat certain ocular diseases.

ORAL AND MAXILLOFACIAL SURGEON. A dentist who is trained to perform surgery to correct injuries, defects, or conditions of the mouth, teeth, jaws, and face.

ORAL REHYDRATION SOLUTION (ORS). A liquid preparation developed by the World Health Organization that can decrease fluid loss in persons with diarrhea. Originally developed to be prepared with materials available in the home, commercial preparations are also available.

ORAL SURGEON. A dentist who specializes in surgical procedures of the mouth, including extractions.

ORBIT. The eye socket, which contains the eyeball, muscles, nerves, and blood vessels that serve the eye.

ORCHIECTOMY. Surgical removal of the testes as a way of treating prostate cancer by eliminating the production of testosterone.

ORCHIOPEXY. The surgical securing of the testis to prevent torsion.

ORCHITIS. Inflammation or swelling of the scrotal sac containing the testicles.

ORGAN PROCUREMENT. The process of donor screening and the evaluation, removal, preservation, and distribution of organs for transplantation.

ORGANELLE. Specialized structure within a cell, which is separated from the rest of the cell by a membrane composed of lipids and proteins, where chemical and metabolic functions take place.

ORGANIC BRAIN DISORDER. An organic brain disorder refers to impaired brain function due to damage or deterioration of brain tissue.

ORGANIC FOOD. Food grown without the use of synthetic pesticides and fertilizers.

ORGANIC ILLNESS. A physically, biologically based illness.

ORGANIC MERCURY. Poisonous compounds containing mercury and carbon, such as methylmercury, ethylmercury, and phenylmercury.

ORGANISM. A single, independent life form, such as a bacterium, a plant, or an animal.

ORGASM. The climax of sexual excitement, usually characterized by vaginal contractions by the female and ejaculation of semen by the male.

ORGASMIC DISORDER. The impairment of the ability to reach sexual climax.

ORLISTAT. A drug that inhibits lipase.

OROPHARYNX. The part of the airway into which the mouth leads.

ORPHAN DRUG. A drug that is known to be useful in treatment but lacks sufficient funding for further research and development.

ORTHODONTHIC TREATMENT. The process of straightening teeth to correct their appearance and function.

ORTHOGNATHIC SURGERY. Surgery to alter the relationships of the teeth and/or supporting bones, usually in conjunction with orthodontic treatment.

ORTHOKERATOLOGY. A method of reshaping the cornea using a contact lens. It is not considered a permanent method to reduce myopia.

ORTHOPEDICS. A medical specialty concerned with treating diseases, injuries, and malformations of the bones and supporting structures, such as tendons, ligaments, joints, and muscles.

ORTHOPEDIST. A doctor specializing in treatment of the skeletal system and its associated muscles and joints.

(c) 2011 Cengage Learning. All Rights Reserved.

ORTHOPNEA. Difficulty in breathing that occurs while the patient is lying down.

ORTHOPOXVIRUS. The genus of viruses that includes monkeypox, smallpox, cowpox, and camelpox.

ORTHOSIS. An external device, such as a splint or a brace, that prevents or assists movement.

ORTHOSTATIC HYPOTENSION. A drop in blood pressure that causes faintness or dizziness and occurs when one rises to a standing position. Also known as postural hypotension.

ORTHOTIC. A device or brace to control, correct, or compensate for a bone deformity.

ORTHOTIST. A health care professional who is skilled in making and fitting orthopedic appliances.

OSLER'S NODES. Small, raised, reddish, tender areas associated with endocarditis, commonly found inside the fingers or toes.

OSMOLALITY. A measurement of urine concentration that depends on the number of particles dissolved in it. Values are expressed as milliosmols per kilogram (mOsm/kg) of water.

OSMOTHERAPY. Intravenous injection or oral administration of an agent that induces dehydration. The goal of dehydration is to reduce accumulated fluid in the brain.

OSMOTIC PRESSURE. Pressure that occurs when two solutions of differing concentrations are separated by a semipermeable membrane, such as a cellular wall, and the lower concentration solute is drawn across the membrane into the higher concentration solute (osmosis).

OSSICLES. The three small bones of the middle ear: the malleus (hammer), the incus (anvil) and the stapes (stirrup). These bones help carry sound from the eardrum to the inner ear.

OSTEOARTHRITIS. A type of arthritis marked by chronic degeneration of the cartilage of the joints, leading to pain and sometimes loss of function.

OSTEOBLASTS. Bone cells that build new bone tissue.

OSTEOCLASTS. Bone cells that break down and remove bone tissue.

OSTEOCONDUCTION. Provision of a scaffold for the growth of new bone.

OSTEOCYTES. Bone cells that maintain bone tissue.

OSTEOGENESIS. Growth of new bone.

OSTEOGENESIS IMPERFECTA. A genetic disorder involving defective development of connective tissues, characterized by brittle and fragile bones that are easily fractured by the slightest trauma.

OSTEOINDUCTION. Acceleration of new bone formation by chemical means.

OSTEOLYTIC LESION. Soft spot or hole in bone caused by cancer cells.

OSTEOMALACIA. A softening of bones caused by lack of vitamin D and/or calcium in the diet.

OSTEOMYELITIS. An inflammation of bone or bone marrow, often caused by bacterial infections. Chronic melioidosis may cause osteomyelitis.

OSTEOPATHY. A system of medical practice that believes that the human body can make its own remedies to heal infection. It originally used manipulative techniques but also added surgical, hygienic, and medicinal methods when needed.

OSTEOPENIA. Reduction in bone mass, usually caused by a lowered rate of formation of new bone that is insufficient to keep up with the rate of bone destruction. Osteopenia often occurs together with amenorrhea and eating disorders in female athletes. It can lead to premature osteoporosis if left untreated.

OSTEOPHYTE. Also referred to as bone spur, it is an outgrowth or ridge that forms on a bone.

OSTEOPOROSIS. The excessive loss of calcium from the bones, causing the bones to become fragile and break easily. Postmenopausal women are especially vulnerable to this condition because estrogen, a hormone that protects bones against calcium loss, decreases drastically after menopause.

OSTOMY. A surgically created opening in the abdomen for elimination of waste products (urine or stool).

OTIC. Pertaining to the ear.

OTITIS. An infection of the ear.

OTITIS MEDIA. Infection of the middle ear.

OTOLARYNGOLOGIST. A doctor who specializes in diagnosing and treating disorders of the ears, nose, and throat; also called an otorhinolaryngologist.

OTOLOGIC. Relating to the study, diagnosis, and treatment of diseases of the ear and related structures.

OTOSCLEROSIS. A disease that scars and limits the motion of the small conducting bones in the middle ear.

(c) 2011 Cengage Learning. All Rights Reserved.

OTOSCOPE. A handheld instrument with a tiny light and a funnel-shaped attachment called an ear speculum, which is used to examine the ear canal and eardrum.

OTOTOXIC. Damaging to the nerves controlling the senses of hearing and balance.

OUTPATIENT SURGERY. Also called same-day or ambulatory surgery. The patient arrives for surgery and returns home on the same day.

OVA. Eggs.

OVAL WINDOW. A tiny opening at the entrance to the inner ear.

OVARIAN CYST. A benign or malignant growth on an ovary. An ovarian cyst can disappear without treatment or become extremely painful and have to be surgically removed.

OVARIAN FOLLICLES. Structures found within the ovary that produce eggs.

OVARIAN TORSION. Twisting of the ovary due to the influence of another condition or disease, resulting in extreme lower abdominal pain.

OVARY. One of the two almond-shaped glands in the female reproductive system responsible for producing eggs and the hormones estrogen and progesterone.

OVERBITE. Protrusion of the upper teeth over the lower teeth.

OVERWEIGHT. A BMI between 25.0 and 30.0.

OVULATION. The phase of the female monthly cycle when a developed egg is released from the ovary into the fallopian tube for possible fertilization.

OVUM (PLURAL, OVA). The reproductive cell of the female, which contains genetic information and participates in the act of fertilization. Also popularly called the egg.

OXALATE. A salt of oxalic acid produced during metabolism and excreted in the urine.

OXIDATION. Interaction in which one molecule removes an electron from another molecule to stabilize itself.

OXYGEN FREE RADICALS. Reactive molecules containing oxygen that can cause cell damage.

OXYGENATED BLOOD. Blood carrying oxygen through the body.

OXYTOCIN. A hormone secreted in the brains of mammals that acts as a neurotransmitter in the brain and also functions in sexual arousal, maternal behavior, and emotional bonding in humans. Synthetic oxytocin is used to induce or support labor in difficult childbirths.

OZONE. A form of oxygen with three atoms in its molecule (O_3), produced by an electric spark or ultraviolet light passing through air or oxygen. Ozone is used therapeutically as a disinfectant and oxidative agent.

P

PACEMAKER. An electrical device that has electrodes attached to the heart to stimulate the heart to beat normally. Pacemakers can be internal (placed under the skin) or external, with the electrodes placed on the skin or threaded through a tube placed into the heart.

PAGET'S DISEASE. A disease, whose cause is unknown, that is generally found in older people. Symptoms include bone pain, bowed legs, curved spine, and broken bones. Another name for this disease is osteitis deformans.

PAGOPHAGIA. The compulsive eating of ice.

PAIN DISORDER. A psychiatric disorder in which pain in one or more parts of the body is caused or made worse by psychological factors. The lower back is one of the most common sites for pain related to this disorder.

PALATINE TONSILS. The tonsils that can be seen at the back of the throat and are the tonsils most commonly affected by tonsillitis.

PALLIATIVE. Referring to any type of treatment that is given to relieve the symptoms of a disease rather than to cure it.

PALLIDOTOMY. A surgical procedure that destroys a small part of a tiny structure within the brain called the globus pallidus internus. This structure is part of the basal ganglia, a part of the brain involved in the control of willed (voluntary) movement of the muscles.

PALLOR. Extreme paleness in the color of the skin.

PALPATE. To examine the body by touching or pressing with the fingers or the palm of the hand.

PALPATION. The examination of the body using the sense of touch. There are two types: light and deep.

PALPEBRAL FISSURE. Eyelid opening.

(c) 2011 Cengage Learning. All Rights Reserved.

PALPITATION. Rapid, forceful, throbbing, or fluttering heartbeat.

PALSY. Uncontrolable tremors.

PANCARDITIS. Inflammation of the lining of the heart, the sac around the heart, and the muscle of the heart.

PANCHAKARMA. Intensive Ayurvedic cleansing and detoxification program.

PANCREAS. An elongated gland situated across the back of the abdomen behind the stomach. It secretes both digestive enzymes and hormones. Pancreatic hormones regulate the level of sugar in the blood.

PANCREATECTOMY. Partial or total surgical removal of the pancreas.

PANCREATIC INSUFFICIENCY. Reduction or absence of pancreatic secretions into the digestive system due to scarring and blockage of the pancreatic duct.

PANCREATICODUODENECTOMY. Removal of all or part of the pancreas along with the duodenum. Also known as ''Whipple's procedure'' or ''Whipple's operation.''

PANCREATITIS. Inflammation of the pancreas, either acute (sudden and episodic) or chronic, usually caused by excessive alcohol intake or gallbladder disease.

PANDAS DISORDERS. A group of childhood disorders associated with such streptococcal infections as scarlet fever and strep throat. The acronym stands for Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcal Infections.

PANDEMIC. The occurrence of a disease that in a short time infects a large percentage of the population over a wide geographical area.

PANHYPOPITUITARISM. Generalized decrease of all of the anterior pituitary hormones.

PANIC ATTACK. A time-limited period of intense fear accompanied by physical and cognitive symptoms. Panic attacks may be unexpected or triggered by specific internal or external cues.

PANIC DISORDER. A disorder in which people have sudden and intense attacks of anxiety in certain situations. Symptoms such as shortness of breath, sweating, dizziness, chest pain, and extreme fear often accompany the attacks.

PANNICULITIS. Inflammation of fatty tissue.

PANNUS. Overgrowth of connective tissue on the articular surface of a joint.

PANTETHEINE. A growth factor substance essential in humans, and a constituent of coenzyme A.

PAP TEST. The common term for the Papanicolaou test, a simple smear method of removing cervical cells to screen for abnormalities that indicate cancer or a precancerous condition.

PAPAVERINE. A smooth muscle relaxant sometimes injected into the penis as a treatment for impotence.

PAPILLARY CARCINOMA. A type of breast cancer that primarily occurs in older women. On ultrasound, this type of tumor may look like a solid or complex mass, or it may show up as solid tissue protruding into a cyst.

PAPILLOMA. A benign growth on the skin or mucous membrane. Viruses that cause these growths are called human papillomaviruses (HPVs).

PAPILLOMAVIRUS. A member of a group of viruses associated with warts and cervical cancer.

PAPULE. A small hard elevation of the skin.

PARACENTESIS. A procedure in which fluid is drained from a body cavity by means of a catheter placed through an incision in the skin.

PARALYSIS. Loss of the ability to move one or more parts of the body.

PARAMYXOVIRUS. A genus of viruses that includes the causative agent of mumps.

PARANEOPLASTIC SYNDROME. A set of symptoms that is associated with cancer but is not directly caused by the cancer.

PARANOIA. An unfounded or exaggerated distrust of others, sometimes reaching delusional proportions.

PARAPHILIA. Recurring strong sexual arousal to fantasies, objects, situations, or individuals that are not considered normal in the individual's culture.

PARAPHIMOSIS. The entrapment of a retracted foreskin behind the coronal sulcus, a groove that separates the shaft and head of the penis.

PARAPROTEIN. M-protein; abnormal immunoglobulin produced in multiple myeloma.

PARASITE. An organism that lives and feeds in or on another organism (the host) and does nothing to benefit the host.

PARASITIC. Of or relating to a parasite.

(c) 2011 Cengage Learning. All Rights Reserved.

PARASOMNIA. A primary sleep disorder in which the person's physiology or behaviors are affected by sleep, the sleep stage, or the transition from sleeping to waking.

PARASYMPATHETIC NERVOUS SYSTEM. The division of the autonomic (involuntary or unwilled) nervous system that slows heart rate, increases digestive and gland activity, and relaxes the sphincter muscles that close off body organs.

PARASYMPATHOMIMETIC. An agent whose effects mimic those resulting from stimulation of the parasympathetic nerves.

PARENTERAL. Administered inside the body but outside the digestive tract.

PARENTERAL NUTRITION. Liquid nutrition provided through tubes that are placed in the veins.

PARESTHESIA. A prickly, tingling, or burning sensation on the skin.

PARIETAL CELLS. Cells of the gastric glands in the stomach lining that secrete hydrochloric acid.

PARKINSON'S DISEASE. A neurological disorder caused by deficiency of dopamine, a neurotransmitter, which is a chemical that assists in transmitting messages between the nerves within the brain. It is characterized by muscle tremor or palsy and rigid movements.

PARKINSONISM. A group of conditions that all have these typical symptoms in common: tremor, rigidity, slow movement, and poor balance and coordination.

PARONYCHIA. Inflammation of the folds of skin that surround a nail.

PAROTID GLAND. The salivary gland that lies below and in front of each ear.

PAROTITIS. Inflammation and swelling of the salivary glands.

PAROXETINE HYDROCHLORIDE. An SSRI that is used to treat mental depression, OCD, anxiety, and various other disorders.

PAROXYSM. A sudden attack of symptoms.

PAROXYSMAL NOCTURNAL DYSPNEA (PND). A form of dyspnea characterized by the patient's waking from sleep unable to breathe.

PAROXYSMAL NOCTURNAL HEMOGLOBINURIA (PNH). A rare complement disorder characterized by episodes of red blood cell destruction (hemolysis) and blood in the urine (hemoglobinuria) that is worse at night.

PARTIAL DENTURE. A removable bridge that usually clasps onto only one abutment.

PARTIAL PARENTERAL NUTRITION (PPN). Partial nutrition obtained by the injection of a solution containing some essential nutrients into a vein; intended to temporarily supplement the diet when a patient cannot tolerate consuming enough food to meet daily nutritional requirements.

PARTIAL PRESSURE. The pressure exerted by one of the gases in a mixture of gases. The partial pressure of the gas is proportional to its concentration in the mixture. The total pressure of the gas mixture is the sum of the partial pressures of the gases in it (Dalton's Law) and as the total pressure increases, each partial pressure increases proportionally.

PARTIAL SEIZURE. A seizure that starts in one particular part of the brain. The abnormal electrical activity may remain confined to that area, or may spread to the entire brain. Also called a focal seizure.

PARTIAL THROMBOPLASTIN TIME. A test that checks the clotting factors of the intrinsic pathway.

PASSIVE IMMUNITY. Immunity produced by providing a person with antibodies from another source than self. Infants are born with passive immunity acquired from their mothers.

PASSIVE IMMUNIZATION. Treatment that provides immunity through the transfer of antibodies obtained from an immune individual.

PASTEURELLOSIS. A bacterial infection caused by *Pasteurella multocida*. Pasteurellosis is characterized by inflammation around the wound site and may be accompanied by bacteria in the bloodstream and infection in tissues and organs.

PASTEURIZATION. A process during which milk is heated up and maintained at a particular temperature long enough to kill bacteria.

PASTIA'S LINES. Red lines in the folds of the skin, especially in the armpit and groin, that are characteristic of scarlet fever.

PATCH TEST. Test in which different antigens (substances that cause an allergic reaction) are introduced into a patient's skin via a needle prick or scratch and then observed for evidence of an allergic reaction to one or more of them. Also known as a scratch test.

PATELLA. The kneecap.

(c) 2011 Cengage Learning. All Rights Reserved.

PATENCY. Being widely open. A blood vessel that has been widened or reopened is said to be patent.

PATENT DUCTUS ARTERIOSUS. A congenital defect in which the temporary blood vessel connecting the left pulmonary artery to the aorta in the fetus doesn't close in the newborn.

PATERNAL. From one's father.

PATHOGEN. Any biological agent that causes illness or disease in its host. A pathogen may be a virus, bacterium, fungus, or prion.

PATHOGENIC. Disease-causing.

PATHOLOGIC. Characterized by disease or the structural and functional changes due to disease. Pathologic heart murmurs may indicate a heart defect.

PATHOLOGIST. A doctor who specializes in the diagnosis of disease by studying cells and tissues under a microscope.

PATHOLOGY. The branch of medicine that looks at the abnormal changes in cells and tissues that signal disease.

PATIENT YEARS. In clinical trials, the number of patients multiplied by the number of years that they were followed in a study divided by the number of study events that occurred.

PAUCIARTICULAR JUVENILE RA. Rheumatoid arthritis (RA) found in children that affects less than four joints.

PAVOR NOCTURNUS. Another term for sleep terror disorder.

PCI. A type of radiotherapy that is used to prevent tumors from growing in the brain.

PEAK FLOW. A measurement of the maximum speed of a patient's expiration (breathing out). It is also known as the peak expiratory flow rate or PEFR. Peak flow is measured by a small handheld device called a peak flow meter.

PECTUS CARINATUM. An abnormality of the chest in which the sternum (breastbone) is pushed outward. It is sometimes called "pigeon breast."

PECTUS EXCAVATUM. An abnormality of the chest in which the sternum (breastbone) sinks inward; sometimes called "funnel chest."

PEDICLE FLAP. A section of tissue, with its blood supply intact, that is maneuvered to another part of the body; also called an attached flap.

PEDICULICIDE. Any substance that kills lice.

PEDICULOSIS (PLURAL, PEDICULOSES). A lice infestation.

PEDOPHILE. A person who sexually abuses children.

PEDOPHILIA. A sexual perversion in which children are the preferred sexual object.

PEG-ADA. An orphan drug that is useful in treating severe combined immunodeficiency related to adenosine deaminase deficiency.

PELLEGRA. A condition caused by a dietary deficiency of one of the B vitamins, called niacin.

PELVIC EXAM. A gynecological exam of the female reproductive organs.

PELVIC EXENTERATION. Extensive surgery to remove the uterus, ovaries, pelvic lymph nodes, part or all of the vagina, and the bladder, rectum, and/or part of the colon.

PELVIC INFLAMMATORY DISEASE (PID). Inflammation of the female genital tract, especially of the fallopian tubes, caused by any of several microorganisms, chiefly chlamydia and gonococci, and characterized by severe abdominal pain, high fever, vaginal discharge, and in some cases destruction of tissue that can result in sterility.

PELVIC ORGANS. The organs inside of the body that are located within the confines of the pelvis. This includes the bladder and rectum in both sexes and the uterus, ovaries, and fallopian tubes in females.

PEMPHIGUS. An autoimmune disorder in which the immune system produces antibodies against specific proteins in the skin and mucous membrane. These antibodies produce a reaction that leads to a separation of skin cells.

PENICILLAMINE (CUPRIMINE, DEPEN). A drug used to treat medical problems (such as excess copper in the body and rheumatoid arthritis) and to prevent kidney stones. It is also sometimes prescribed to remove excess lead from the body.

PENICILLIN. An antibiotic that is used to treat bacterial infections.

PENTAMIDINE ISETHIONATE. An antibiotic used to treat and prevent pneumocystis pneumonia.

PEPTIC. Induced by or associated with the action of digestive secretions.

PEPTIC ULCER. A wound in the bowel that can be caused by stomach acid or a bacterium called *Helicobacter pylori*.

(c) 2011 Cengage Learning. All Rights Reserved.

PEPTIC ULCER DISEASE (PUD). A stomach disorder marked by corrosion of the stomach lining due to the acid in the digestive juices.

PERCUSSION. An assessment method in which the surface of the body is struck with the fingertips to obtain sounds that can be heard or vibrations that can be felt. It can determine the position, size, and consistency of an internal organ. It is done over the chest to determine the presence of normal air content in the lungs, and over the abdomen to evaluate air in the loops of the intestine.

PERCUTANEOUS. Performed through the skin, from the Latin *per*, meaning through, and *cutis*, meaning skin.

PERCUTANEOUS BIOPSY. A biopsy in which a needle is inserted and a tissue sample removed through the skin.

PERCUTANEOUS TRANSHEPATIC CHOLANGIOGRAPHY. An x-ray examination of the bile ducts. A needle is passed through the skin (percutaneous) across or over the liver (transhepatic) and directly into a bile duct to inject a contrast dye. The dye enhances the x-ray image mapping the system of bile ducts (cholangiography).

PERENNIAL. Present at all seasons of the year.

PERFECT USE. A measurement of the effectiveness of a contraceptive based only on those who use the method correctly and use it every time they have intercourse. It is also called the method effectiveness rate.

PERFORATION. A hole.

PERFUSION. Blood flow through an organ or tissue.

PERFUSION LUNG SCAN. A scan that shows the pattern of blood flow in the lungs.

PERICARDIAL EFFUSION. An accumulation of excess fluid in the pericardial sac that surrounds the heart.

PERICARDIOCENTESIS. A procedure used to drain fluid out of the sac surrounding the heart. This is done by inserting a needle through the chest and into the sac.

PERICARDITIS. Inflammation of the pericardium, the membrane surrounding the heart.

PERICARDIUM. The pericardium is the thin, sac-like membrane that surrounds the heart. It has two layers: the serous pericardium and the fibrous pericardium.

PERICORONITIS. A gum condition in which irritation and inflammation are produced by the crown of an incompletely erupted tooth.

PERINATAL. Refers to the period shortly before and after birth, generally from around the 20th week of pregnancy to one to four weeks after birth.

PERINATAL INFECTION. A maternal infection that is transmitted to the fetus after membrane rupture or during labor or delivery.

PERINATOLOGIST. A specialist in the branch of obstetrics that deals with high-risk pregnant women.

PERINEUM. The area between the thighs that lies behind the genital organs and in front of the anus; also known as the perineal area.

PERIODIC LIMB MOVEMENTS IN SLEEP (PLMS). Random movements of the arms or legs that occur at regular intervals of time during sleep.

PERIODONTAL. Pertaining to the gums.

PERIODONTITIS. A gum disease that destroys the structures supporting the teeth, including bone.

PERIOSTEUM. A fibrous vascular membrane that covers bones.

PERIPHERAL NERVES. Nerves throughout the body that carry information to and from the spinal cord.

PERIPHERAL NERVOUS SYSTEM (PNS). One of the two major divisions of the nervous system. PNS nerves link the central nervous system with sensory organs, muscles, blood vessels, and glands.

PERIPHERAL NEUROPATHY. A disease affecting the portion of the nervous system outside the brain and spinal chord. One or more nerves can be involved, causing sensory loss, muscle weakness and shrinkage, and decreased reflexes.

PERIPHERAL PRECOCIOUS PUBERTY. Precocious puberty resulting from the presence of sex steroids independent of the activation of the HPG axis. It is also called precocious pseudopuberty.

PERIPHERAL STEM CELL TRANSPLANT. The process of transplanting peripheral stem cells instead of using bone marrow. The stem cells in the circulating blood that are similar to those in the bone marrow are given to the patient after treatment to help the bone marrow recover and continue producing healthy blood cells. A peripheral stem cell transplant may also be used to supplement a bone marrow transplant.

PERIPHERAL STEM CELLS. Stem cells that are taken directly from the circulating blood and used for transplantation. Stem cells are more concentrated in the bone marrow, but they can also be extracted from the bloodstream.

(c) 2011 Cengage Learning. All Rights Reserved.

PERIPHERAL VASCULAR DISEASE. A disease affecting blood vessels, especially in the arms, legs, hands, and feet.

PERIPHERAL VISION. The ability to see objects that are not located directly in front of the eye. Peripheral vision allows people to see objects located on the side or edge of their field of vision.

PERISTALSIS. The waves of muscular contraction in the intestines that push the food along during the process of digestion.

PERITONEAL FLUID. Fluid from the abdominal cavity.

PERITONEUM. The transparent membrane lining the abdominal cavity that holds organs, such as the intestines, in place.

PERITONITIS. Inflammation of the peritoneum, the membrane surrounding the abdominal contents.

PERMEABLE. Capable of allowing substances to pass through.

PERMETHRIN. A synthetic pyrethroid for killing lice.

PERNICIOUS ANEMIA. One of the main types of anemia, caused by inadequate absorption of vitamin B_{12}. Symptoms include tingling in the hands, legs, and feet; spastic movements; weight loss; confusion; depression; and decreased intellectual function.

PEROXIDE. A bleaching agent that is a compound consisting of two atoms of oxygen connected by a single bond.

PEROXINS. Proteins that are responsible for forming the peroxisomal membrane and transporting other proteins into the peroxisome; these proteins are encoded by various PEX genes.

PEROXISOME. A cellular organelle or microbody that contains various enzymes that are responsible for the production of cellular components and the breakdown of toxic waste products.

PEROXISOME BIOGENESIS DISORDER (PBD). An inherited disorder that disrupts the formation and functioning of peroxisomes.

PERPETRATOR. The legal term for a person who commits a crime.

PERSECUTORY DELUSION. A fixed, false, and inflexible belief that others are engaging in a plot or plan to harm an individual.

PERSEVERATION. Continuous involuntary repetition of speech or behavior.

PERSONALITY. The organized pattern of behaviors and attitudes that makes a human being distinctive. Personality is formed by the ongoing interaction of temperament, character, and environment.

PERVASIVE DEVELOPMENTAL DISORDER (PDD). The term used by the American Psychiatric Association for individuals who meet some but not all of the criteria for autism.

PESSARY. A device inserted into the vagina to support sagging organs.

PETECHIAE. Small pinpoint hemorrhages in skin or mucous membranes caused by the rupture of capillaries.

PETROLEUM JELLY OR OINTMENT. Petrolatum, a gelatinous substance obtained from oil that is used as a protective dressing.

PEYRONIE'S DISEASE. A disease resulting from scarring of the corpus cavernosa, causing painful erections.

PH. A measure of the acidity of a fluid. On a scale of 1 to 14, a pH of 7 is neutral. Higher pH readings are alkaline and lower pH readings are acidic.

PHACOEMULSIFICATION. Surgical procedure to remove a cataract using sound waves to disintegrate the lens, which is then removed by suction.

PHAGOCYTIC CELLS. A cell that ingests microorganisms and foreign particles.

PHAGOCYTOSIS. A process by which a white blood cell envelopes and digests debris and microorganisms to remove them from the blood.

PHALANX. A bone of the fingers or toes.

PHALILALIA. Involuntary echoing of the last word, phrase, sentence, or sound vocalized by oneself.

PHANTOM LIMB. The perception that a limb is present (and throbbing with pain) after it has been amputated.

PHANTOM PAIN. Pain, tingling, itching, or numbness in the place where an amputated limb used to be.

PHARMACEUTICAL. Pertaining to drugs.

PHARMACO-DYNAMICS. The study of the relationships and interactions of herbs.

PHARMACOLOGICAL. Referring to therapy that relies on drugs.

(c) 2011 Cengage Learning. All Rights Reserved.

PHARYNGITIS. Inflammation of the throat, accompanied by dryness and pain.

PHARYNX. The muscular cavity that leads from the mouth and nasal passages to the larynx and esophagus.

PHASE CONTRAST MICROSCOPE. A light microscope in which light is focused on the sample at an angle to produce a clearer image.

PHENOTHIAZINE-DERIVATIVE DRUGS. A large family of drugs derived from phenothiazine, a compound that in itself is too poisonous for human consumption. Phenothiazine derivatives include tranquilizers, medications that prevent vomiting, antihistamines, and drugs used to enhance the effectiveness of anesthesia.

PHENTERMINE. An amphetamine prescribed for appetite suppression.

PHENYLALANINE. An essential amino acid that must be obtained from food since the human body cannot manufacture it.

PHENYLKETONURIA (PKU). An enzyme deficiency present at birth that disrupts metabolism and causes brain damage. This rare inherited defect may be linked to the development of autism.

PHENYTOIN (DILANTIN). Anti-convulsive medication used to treat seizure disorders.

PHEOCHROMOCYTOMA. A tumor of specialized cells of the adrenal gland.

PHILADELPHIA CHROMOSOME. An abnormal chromosome that is found in patients with chronic myelogenous leukemia.

PHIMOSIS. A tightening of the foreskin that may close the opening of the penis.

PHLEBITIS. Inflammation of a vein.

PHLEBOTOMIST. Health care professional trained to obtain samples of blood.

PHLEBOTOMY. Drawing blood from a vein for diagnosis or treatment. Phlebotomy is sometimes used in the treatment of hemoglobinopathies to lower the iron concentration of the blood.

PHLEGM. Thick mucus produced in the air passages.

PHOBIA. A fear of a specific situation, object, or type of object. Phobias are often considered illogical or irrational, as the situation or object does not pose any significant danger for the individual experiencing the phobia.

PHONICS. A system to teach reading by teaching the speech sounds associated with single letters, letter combinations, and syllables.

PHOROPTER. The instrument used to measure refractive status of the eyes. It contains many lenses that are changed in front of the eyes while the patient is looking at an eye chart. The patient is asked to choose which lens produces a clearer image.

PHOSPHODIESTERASE–5 (PDE5) INHIBITORS. The drugs Viagra, Levitra, and Cialis, which are used to treat erectile dysfunction.

PHOTOCOAGULATION. Cancer treatment in which the tumor is destroyed by an intense beam of laser light.

PHOTODYNAMIC THERAPY (PDT). A treatment for tumors in which a light-sensitive dye is injected into the blood (or skin) to be taken up selectively by the tumors. Light of a specific wavelength is then applied to the affected area to kill the tumors.

PHOTON. A light particle.

PHOTOPHOBIA. An extreme sensitivity to light.

PHOTOPIGMENT. Pigment that is most sensitive to a particular wavelength of light.

PHOTORECEPTORS. Specialized nerve cells (rods and cones) in the retina that are responsible for vision.

PHOTOREFRACTIVE KERATECTOMY (PRK). A type of refractive eye surgery using a laser to change the shape of the cornea.

PHOTOSENSITIVITY. An abnormally heightened reaction to light.

PHOTOSENSITIZER. A chemical compound that can be excited (activated) by light of a specific wavelength.

PHOTOTHERAPY. Also called light therapy, the patient is exposed to a bright light to compensate for reduced exposure to sunlight.

PHOTOTOXIC. Causes a harmful skin reaction when exposed to sunlight.

PHYLLOQUINONE. An alternate name for vitamin K_1.

PHYSIATRIST. A physician who specializes in physical medicine.

PHYSICAL ACTIVITY. Any activity that involves moving the body and burning calories.

PHYSICAL FITNESS. A combination of muscle strength, cardiovascular health, and flexibility that is usually attributed to regular exercise and good nutrition.

(c) 2011 Cengage Learning. All Rights Reserved.

PHYSICAL MANIPULATION. The use of deep massage, spinal alignment, and joint manipulation to stimulate tissues.

PHYSIOLOGIC. Refers to physiology, particularly normal, healthy, physical functioning.

PHYSIOLOGICAL. Dealing with the functions and processes of the body.

PHYTO- (AS IN PHYTOCHEMICAL, PHYTOMEDICINAL, AND PHYTOTHERAPY). Meaning, or pertaining to, a plant or plants.

PHYTOESTROGENS. Compounds found in plants that can mimic the effects of estrogen in the body.

PIA MATER. The innermost layer of the meninges.

PICA. A medical disorder characterized by cravings for dirt, ice cubes, paper, starch, clay, or other non-nutritive items. It is often a sign of iron deficiency or hemolytic anemia.

PICK'S DISEASE. A rare type of primary dementia that affects the frontal lobes of the brain. It is characterized by a progressive loss of social skills, language, and memory, leading to personality changes and sometimes loss of moral judgment.

PIGEON BREAST (ALSO KNOWN AS PECTUS CARINATUM). A chest shape with a central projection resembling the keel of a boat.

PILONIDAL CYST. A special kind of abscess that occurs in the cleft between the buttocks. Forms frequently in adolescence after long trips that involve sitting.

PINWORM. Enterobius vermicularis, a nematode worm of the family Oxyuridae that causes parasitic infestation of the intestines and cecum. Pinworm is endemic in both temperate and tropical regions and common especially in school age children.

PIPERONYL BUTOXIDE. A liquid organic compound that enhances the activity of insecticides.

PIRIFORMIS. A muscle in the pelvic girdle that is closely associated with the sciatic nerve.

PITTING EDEMA. A swelling in the tissue under the skin, resulting from fluid accumulation, that is measured by the depth of indentation made by finger pressure over a boney prominence.

PITUITARY GLAND. A gland located at the base of the brain and controlled by the hypothalamus. It controls most endocrine functions and is responsible for things such as kidney function, lactation, and growth and development.

PLACEBO. A pill or liquid given during the study of a drug or dietary supplement that contains no medication or active ingredient. Usually study participants do not know if they are receiving a pill containing the drug or an identical-appearing placebo.

PLACENTA. The organ that provides oxygen and nutrition from the mother to the fetus during pregnancy. The placenta is attached to the wall of the uterus and leads to the fetus via the umbilical cord.

PLACENTA PREVIA. A low-lying placenta that covers part or all of the inner opening of the cervix. This can result in heavy bleeding during labor and delivery, which can be dangerous for the mother and baby.

PLACENTAL ABRUPTION. Separation of the placenta from the uterine wall before the baby is born, cutting off blood flow to the baby.

PLAGUE. A highly infectious disease that can be fatal if not treated promptly. The bacteria that cause plague mainly infect rats, mice, squirrels, and other wild rodents. The disease is passed to people through fleas. Infected people can then spread the disease to other people.

PLANTAR FASCIA. A tough fibrous band of tissue surrounding the muscles of the sole of the foot. Also called plantar aponeurosis.

PLAQUE. A compound made up of fat, cholesterol, calcium, and other substances found in the blood. It can stick to the walls of arteries, partially or totally blocking blood flow.

PLAQUE (DENTAL). A sticky film of saliva, food particles, and bacteria that attaches to the tooth surface and causes decay.

PLASMA. Clear, yellow- or straw-colored fluid that is the liquid component of blood and lymphatic fluid.

PLASMA CELL. Type of white blood cell that produces antibodies; derived from an antigen-specific B cell.

PLASMALOGEN. Any of a group of phospholipids; plasmalogen synthesis is disrupted in ZS.

PLASMAPHERESIS. Plasma exchange transfusion; the separation of serum from blood cells to treat hyperviscosity of the blood.

PLATELET. A small, disk-shaped body in the blood that has an important role in blood clotting: they form the initial plug at the rupture site of a blood vessel.

PLATELET AGGREGATION. The clumping together of blood cells, possibly forming a clot.

(c) 2011 Cengage Learning. All Rights Reserved.

PLATYPNEA. Dyspnea that occurs when the patient is sitting up.

PLETHYSMOGRAPHY. A test in which a patient sits inside a booth called a plethysmograph and breathes through a mouthpiece, while pressure and air flow measurements are collected to measure the total lung volume.

PLEURA OR PLEURAE. A delicate membrane that encloses the lungs. The pleura is divided into two areas separated by fluid–the visceral pleura, which covers the lungs, and the parietal pleura, which lines the chest wall and covers the diaphragm.

PLEURAL. Pleural refers to the pleura or membrane that enfolds the lungs.

PLEURAL CAVITY. The space surrounding the lungs, including the membranes covering the lungs and lining the inside of the chest wall.

PLEURAL EFFUSION. An abnormal accumulation of fluid in the pleura, a fibrous membrane that lines the inside of the chest cavity and protects the lungs. This accumulation can cause shortness of breath, cough, and chest pain.

PLEURAL SPACE. The small space between the two layers of the membrane that covers the lungs and lines the inner surface of the chest.

PLEURISY. Chest pain that occurs when a person takes a deep breath.

PLEURITIS. Inflammation of the pleura, the membrane surrounding the lungs.

PNEUMOCOCCAL. Infection by the bacterium *Streptococcus pneumoniae*) that causes acute pneumonia.

PNEUMOCONIOSIS (PLURAL, PNEUMOCONIOSES). Any chronic lung disease caused by inhaling particles of silica or similar substances that lead to loss of lung function.

***PNEUMOCYSTIS CARINII* PNEUMONIA (PCP).** A severe lung infection caused by a parasitic protozoan. The disease mainly affects people with weakened immune systems, such as people with AIDS.

PNEUMOCYSTOSIS. Another name for active PCP infection.

PNEUMONIA. A disease in which the lungs become inflamed. Pneumonia may be caused by bacteria, viruses, or other organisms, or by physical or chemical irritants.

PNEUMONITIS (ASPIRATION). Inflammation of the lung caused by inhaling a liquid, usually carbon based.

PNEUMOTHORAX. Presence of gas or air in the hollow space around the lungs.

PNEUMOVAX. A vaccine that is given to splenectomy patients to protect them against bacterial infections. Other vaccines include Pnu-Imune and Menomune.

PODIATRIST. A physician who specializes in the medical care and treatment of the human foot.

PODIATRY. A medical specialty concerned with treating diseases, injuries, and malformations of the feet.

PODOPHYLLUM RESIN. A medication derived from the May apple or mandrake and used to treat genital warts.

POINT OF VIEW. In a person with dyslexia, this term is used to describe the angle from which their mind's eye views an object. This point of view may be unanchored and moving about, as if several different people were telling what they see all at the same time.

POLYARTHRITIS. A nonspecific term for arthritis involving two or more joints, typically associated with auto-immune forms of arthritis. Symptoms usually include pain, inflammation, and/or swelling in multiple joints.

POLYARTICULAR JUVENILE RA. Rheumatoid arthritis found in children that affects more than four joints.

POLYCARBONATE. A very strong type of plastic often used in safety glasses, sport glasses, and children's eyeglasses. Polycarbonate lenses have approximately 50 times the impact resistance of glass lenses.

POLYCYSTIC KIDNEY DISEASE. A hereditary kidney disease that causes fluid- or blood-filled pouches of tissue called cysts to form on the tubules of the kidneys. These cysts impair normal kidney function.

POLYCYSTIC OVARIAN SYNDROME (PCOS). A condition in which the eggs are not released from the ovaries and instead form multiple cysts.

POLYCYSTIC OVARY DISEASE. A condition in which a woman has little or no menstruation, is infertile, has excessive body hair, and is obese. The ovaries may contain several cysts.

POLYCYTHEMIA VERA. A condition characterized by an unusually large number of red blood cells in the blood due to increased production by the bone marrow. Symptoms include headaches, blurred vision, high blood pressure, dizziness, and night sweats.

POLYDIPSIA. Excessive thirst.

POLYGENIC. A trait or disorder that is determined by several different genes. Most human characteristics,

(c) 2011 Cengage Learning. All Rights Reserved.

including height, weight, and general body build, are polygenic. Schizophrenia and late-onset AD are considered polygenic disorders.

POLYMER. A substance formed by joining smaller molecules. For example, plastic, acrylic, cellulose acetate, cellulose propionate, nylon, etc.

POLYMERASE CHAIN REACTION (PCR). A test performed to evaluate false-negative results to the ELISA and Western blot tests. Numerous copies of a gene are made by separating the two strands of DNA containing the gene segment, marking its location, using DNA polymerase to make a copy, and then continuously replicating the copies. The amplification of gene sequences that are associated with HIV allows for detection of the virus by this method.

POLYMYOSITIS. An inflammation of many muscles.

POLYP. A lump of tissue protruding from the lining of an organ, such as the nose, bladder, or intestine. Polyps can sometimes block the passages in which they are found.

POLYPOSIS. The medical term for the development of multiple polyps on a body part.

POLYSOMNOGRAPHY. A technique for diagnosing sleep disorders with the use of a machine that records the pulse, breathing rate, and other variables while the patient sleeps.

POLYUNSATURATED FAT. Fats that contain two or more double or triple bonds per molecule; examples include fish, safflower, sunflower, corn, and soybean oils.

POLYURIA. Excessive secretion of urine.

PONTIC. An artificial tooth.

PORNOGRAPHY. Sexually explicit pictures, writings, or other material produced for the purpose of sexual arousal.

PORPHYRIA. A disorder in which porphyrins build up in the blood and urine.

PORPHYRIN. A type of pigment found in living things, such as chlorophyll, which makes plants green, or hemoglobin, which makes blood red.

PORTABLE CHEST X RAY. An x ray procedure taken by equipment that can be brought to the patient. The resulting radiographs may not be as high in quality as stationary x-ray radiographs.

PORTAL. An entrance or a means of entrance.

PORTAL HYPERTENSION. A condition caused by cirrhosis of the liver. It is characterized by impaired or reversed blood flow from the portal vein to the liver, an enlarged spleen, and dilated veins in the esophagus and stomach.

PORTAL VEIN. The blood vessel carrying venous blood from the abdominal organs to the liver.

PORTAL VEIN THROMBOSIS. The development of a blood clot in the vein that brings blood into the liver. Untreated portal vein thrombosis causes portal hypertension.

POSITIVE SYMPTOMS. Symptoms of schizophrenia that are characterized by the production or presence of behaviors that are grossly abnormal or excessive, including hallucinations and thought–process disorder. DSM–IV subdivides positive symptoms into psychotic and disorganized.

POSITRON. One of the small particles that make up an atom. A positron has the same mass and amount of charge as an electron, but the positron has a positive charge.

POSITRON EMISSION TOMOGRAPHY (PET) SCAN. An imaging system that creates a picture showing the location of tumor cells in the body. A substance called radionuclide dye is injected into a vein, and the PET scanner rotates around the body to create the picture.

POSTEXPOSURE PROPHYLAXIS (PEP). Any treatment given after exposure to a disease to try to prevent the disease from occurring.

POST-HERPETIC NEURALGIA (PHN). Long-lasting nerve pain caused by herpes zoster.

POSTMENOPAUSAL. A term referring to the time period following menopause.

POSTMORTEM. Referring to the period following death.

POSTPARTUM. Referring to the time period following childbirth.

POST-TRAUMATIC STRESS DISORDER (PTSD). A psychological reaction that continues long after a highly stressful event and is characterized by depression, anxiety, flashbacks, and nightmares.

POSTURAL DRAINAGE. Techniques to help expel excess mucus by specific poistions of the body (that decrease the effects of gravity) combined with manual percussion and vibration over various parts of the lung.

POSTURAL HYPOTENSION (ORTHOSTATIC HYPOTENSION). A sudden drop in blood pressure when rising from a sitting or lying down position.

(c) 2011 Cengage Learning. All Rights Reserved.

POTASSIUM. A mineral found in whole grains, meat, legumes, and some fruits and vegetables, which is important for many body processes, including proper functioning of the nerves and muscles.

POTENTIZATION. The process of increasing the power of homeopathic preparations by successive dilutions and succussions of a mother tincture.

POTENTIZE. The process of transferring the healing energy of a plant into spring water.

POVERTY OF SPEECH. A negative symptom of schizophrenia, characterized by brief and empty replies to questions. It should not be confused with shyness or reluctance to talk.

POX. A pus-filled bump on the skin.

PRADER-WILLI SYNDROME. An uncommon genetic disorder that causes a constant feeling of hunger.

PRAKRITI. An individual's unique dosha pattern.

PRANA. Life sustaining energy centered in the human brain; the first of the five airs of Ayurvedic philosophy; the life force governing inspiration and the conscious intellect.

PRANAYAMA. Yoga method of breathing.

PRECANCEROUS. Abnormal and with a high probability of turning into cancer, but not yet a cancer.

PRECIPITIN. An antibody in blood that combines with an antigen to form a solid that separates from the rest of the blood.

PRECOCIOUS. Developing at an unusually early age.

PRECONCEPTIONAL. This refers to the time period before pregnancy, i.e., conception, occurs.

PREDNISONE. A corticosteroid often used to treat inflammation.

PREECLAMPSIA AND ECLAMPSIA. Disorders of late pregnancy associated with high blood pressure, fluid retention, and protein in the urine. They can cause stillbirth.

PREGNANCY CATEGORY. A system of classifying drugs according to their established risks for use during pregnancy. Category A: Controlled human studies have demonstrated no fetal risk. Category B: Animal studies indicate no fetal risk, but no human studies, or adverse effects in animals, but not in well-controlled human studies. Category C: No adequate human or animal studies, or adverse fetal effects in animal studies, but no available human data. Category D: Evidence of fetal risk, but benefits outweigh risks. Category X: Evidence of fetal risk. Risks outweigh any benefits.

PREMALIGNANT SKIN LESION. An abnormal change in the skin that has a good chance of turning into skin cancer but is not yet cancerous.

PREMATURE ATRIAL BEAT. A beat that occurs before it would normally be expected.

PREMATURE DELIVERY. The birth of a live baby when a pregnancy ends spontaneously after the twentieth week.

PREMATURE EJACULATION. Rapid ejaculation before the person wishes it, usually in less than one to two minutes after beginning intercourse.

PREMENSTRUAL DYSPHORIC DISORDER (PMDD). Premenstrual syndrome (PMS); symptoms including back and abdominal pain, nervousness and irritability, headache, and breast tenderness that occur the week before menstruation.

PREMENSTRUAL SYNDROME. (PMS) A set of symptoms that occur in some women 2–14 days before they begin menstruating each month. Symptoms include headache, fatigue, irritability, depression, abdominal bloating, and breast tenderness.

PREMUTATION. A change in a gene that precedes a mutation; this change does not alter the function of the gene.

PRENATAL DIAGNOSIS. The determination of whether a fetus possesses a disease or disorder while it is still in the womb.

PRENATAL INFECTION. A maternal infection that is transmitted to the fetus through the placenta.

PRENATAL TESTING. Testing for a disease such as a genetic condition in an unborn baby.

PREPUCE. The fold of tissue covering the clitoris in females and the tip of the penis in males.

PRESBYOPIA. A condition affecting people over the age of 40 where the system of accommodation that allows focusing of near objects fails to work because of age-related hardening of the lens of the eye.

PRESENILE DEMENTIA. The original name for Alzheimer's disease.

PRESENILIN (PSEN). Presenilin 1 and presenilin 2 are proteins that are involved in processing amyloid precursor protein (APP). Mutations in the genes encoding these proteins can cause early-onset AD.

(c) 2011 Cengage Learning. All Rights Reserved.

PRESENTATION. The part of the fetus's body that enters into the birth canal first.

PRESSURE POINTS. Specific locations on the feet and hands that correspond to nerve endings that connect to the organs and glands of the human body via the spinal cord.

PRESSURE ULCER. Also known as a decubitus ulcer, pressure ulcers are open wounds that form whenever prolonged pressure is applied to skin covering bony outcrops of the body. Patients who are bedridden are at risk of developing pressure ulcers. Pressure ulcers are commonly known as bedsores.

PRETERM LABOR. Labor before the thirty-seventh week of pregnancy.

PREVALENCE. The percentage of a population that is affected by a specific disease at a given time.

PRIAPISM. A prolonged erection lasting more than four hours.

PRIMARY ENERGY PATTERN. A spiral motion that radiates from the umbilicus; the energy pattern associated with a child in the womb.

PRIMARY GAIN. The immediate relief from guilt, anxiety, or other unpleasant feelings that a patient derives from a symptom.

PRIMARY HEADACHE. A headache that is not caused by another disease or medical condition. Tension headaches are a subtype of primary headache.

PRIMARY PERSONALITY. The core personality of an dissociative identity disorder patient. In women, the primary personality is often timid and passive, and may be diagnosed as depressed.

PRIMARY PROGRESSIVE. A pattern of symptoms of multiple sclerosis in which the disorder progresses without remission, or with occasional plateaus or slight improvements.

PRIMARY SCLEROSING CHOLANGITIS. A chronic disease in which the immune system fails to recognize the cells that compose the bile ducts as part of the same body, and attempts to destroy them. It is frequently associated with another inflammatory disease of the digestive tract, ulcerative colitis.

PRIMARY SLEEP DISORDER. A sleep disorder that cannot be attributed to a medical condition, another mental disorder, or prescription medications or other substances.

PRIMING MEMORY. The memory system that joins perceptual and conceptual representations.

PROBENECID. A drug that corrects hyperuricemia by increasing the urinary excretion of urate.

PROBIOTICS. Food supplements containing live bacteria or other microbes intended to improve or restore the normal balance of microorganisms in the digestive tract.

PROCAINE PENICILLIN. An injectable form of penicillin that contains an anesthetic to reduce the pain of the injection.

PROCESS ADDICTION. Addiction to certain mood-altering behaviors, such as eating, gambling, sexual activity, overwork, and shopping.

PROCESSUS VAGINALIS. A pouch of the peritoneum (lining of the abdominal cavity) that is carried into the scrotum with the descent of the testicles to become the tunica vaginalis.

PROCTITIS. Inflammation of the anus and rectum.

PROCTOSCOPE. An instrument consisting of a thin tube with a light source, used to examine the inside of the rectum.

PROCTOSCOPY. A procedure in which a thin tube containing a camera and a light is inserted into the rectum so the doctor can visually inspect it.

PRODROME. Symptom(s) experienced prior to the onset of a disease. For example, visual disturbances may precede and signal the onset of a migraine headache.

PROGESTERONE. A female hormone that acts on the inner lining of the uterus and prepares it for implantation of the fertilized egg.

PROGESTIN. A synthetic or natural drug that acts on the uterine lining.

PROGNOSIS. The predicted outcome of a disease.

PROGRESSIVE. A term that refers to a disease that gets worse over time.

PROGRESSIVE SUPRANUCLEAR PALSY. A rare disease that gradually destroys nerve cells in the parts of the brain that control eye movements, breathing, and muscle coordination, which causes palsy, or paralysis.

PROHORMONES. A physiologically inactive precursor of a hormone.

PROJECTIVE TEST. A type of psychological test that assesses a person's thinking patterns, observational ability, feelings, and attitudes on the basis of responses to ambiguous test materials. It is not intended to diagnose psychiatric disorders.

(c) 2011 Cengage Learning. All Rights Reserved.

PROKINETIC. A drug that works to speed up the emptying of the stomach and the motility of the intestines.

PROLACTIN. A hormone that helps the breast prepare for milk production during pregnancy.

PROLACTINOMA. A benign (noncancerous) tumor of the pituitary gland that secretes the hormone prolactin.

PROLAPSED UMBILICAL CORD. Occurs when the cord falls into the birth canal, and may even hang out of the mother's vagina. This can cause compression of the cord and lead to decreased oxygen and blood flow to the fetus.

PROLAPSED UTERUS. A uterus that has slipped out of place, sometimes protruding down through the vagina.

PROLIFERATIVE RETINOPATHY. Retinopathy with the growth of new blood vessels (neovascularization).

PRONATION. The lowering or descending of the inner edge of the foot by turning the entire foot outwards.

PROPENSITY. A greater risk for developing a disease.

PROPHYLACTIC. Referring to medications or other treatments given to prevent disease.

PROPHYLAXIS. Preventive. Antibiotic prophylaxis is the use of antibiotics to prevent a possible infection.

PROPIONIBACTERIUM ACNES. Skin bacteria that infect sebaceous follicles, causing acne.

PROPRANOLOL (INDERAL). Medication commonly prescribed to treat high blood pressure; is a beta-adrenergic blocker and can also be used to treat irregular heartbeat, heart attack, migraine, and tremors.

PROPRIOCEPTIVE. Pertaining to proprioception, or the awareness of posture, movement, and changes in equilibrium and the knowledge of position, weight, and resistance of objects as they relate to the body.

PROSTAGLANDIN. A group of molecules that exert local effects on a variety of processes including fluid balance, blood flow, and gastrointestinal function.

PROSTAGLANDIN ANALOGUE. A class of drugs that are similar in structure and function to prostaglandin.

PROSTATE. A donut-shaped gland below the bladder in men that contributes to the production of semen.

PROSTATE GLAND. The gland surrounding the male urethra just below the base of the bladder. It secretes a fluid that constitutes a major portion of the semen.

PROSTATE–SPECIFIC ANTIGEN (PSA). A protein made by the cells of the prostate that is increased by both BPH and prostate cancer.

PROSTHESIS. A synthetic replacement for a missing part of the body such as a knee or a hip.

PROSTHETIC TOOTH. The final tooth that is held in place by the dental implant anchor.

PROSTHETICS. Mechanical devices that replace missing body parts.

PROSTHETIST. A health care professional who is skilled in making and fitting artificial parts (prosthetics) for the human body.

PROTEASE INHIBITORS. The second major category of drug used to treat AIDS that works by suppressing the replication of the HIV virus.

PROTEIN. A substance produced by a gene that is involved in creating the traits of the human body, such as hair and eye color, or is involved in controlling the basic functions of the human body, such as control of the cell cycle.

PROTEINURIA. The presence of protein in the urine exceeding normal levels.

PROTHROMBIN. A type of protein called a glycoprotein that is converted to thrombin during the clotting process.

PROTHROMBIN TIME. A blood test that determines how quickly a person's blood will clot.

PROTOPORPHYRIN. A precursor molecule to the porphyrin molecule.

PROTOPORPHYRIN IX. Protoporphyrin IX is a protein. The measurement of this protein is useful for the assessment of iron status. Hemoglobin consists of a complex of a protein plus heme. Heme consists of iron plus protoporphyrin IX. Normally, during the course of red blood cell formation, protoporphyrin IX acquires iron, to generate heme, and the heme becomes incorporated into hemoglobin. However, in iron deficiency, protophoryrin IX builds up.

PROTOZOA. (Plural form of protozoan) Single-celled organisms (not bacteria) of which about 30 kinds cause disease in humans.

PROXIMAL TUBULE. The portion of the kidney tubule that lies closest to the point at which fluid from the blood enters the tubule.

PRURICEPTORS. Nerve endings specialized to perceive itching sensations.

(c) 2011 Cengage Learning. All Rights Reserved.

PRURITUS. The medical term for itching.

PRUSSIAN BLUE. The common name of potassium ferric hexacyanoferrate, a compound approved in the United States for treatment of thallium poisoning. Prussian blue gets its name from the fact that it was first used by artists in 1704 as a dark blue pigment for oil paints. It has also been used in laundry bluing and fabric printing.

PSEUDODEMENTIA. Depression with symptoms resembling those of dementia. The term "dementia of depression" is now preferred.

PSEUDOGYNECOMASTIA. Enlargement of the male breast caused solely by fat accumulation. It is also called lipomastia.

PSEUDOPHAKIC BULLOUS KERATOPATHY. Painful swelling of the cornea occasionally occurring after surgery to implant an artificial lens in place of a lens affected by cataract.

PSEUDOXANTHOMA ELASTICUM. A hereditary disorder of the connective, or elastic, tissue marked by premature aging and breakdown of the skin and degeneration of the arteries that leads to hemorrhages.

PSORALEN. A family of photosensitizing chemicals that can be found in lemons, celery, and other plants. Chemically synthesized versions are used to augment the effects of UVA light treatments.

PSORIASIS. A common recurring skin disease that is marked by dry, scaly, and silvery patches of skin that appear in a variety of sizes and locations on the body.

PSORIATIC ARTHRITIS MUTILANS. A severe form of psoriatic arthritis that destroys the joints of the fingers and toes and causes the bones to fuse, leaving patients with gnarled and club-like hands and feet.

PSYCHIATRIST. A medical doctor who has completed specialized training in the diagnosis and treatment of mental illness.

PSYCHOACTIVE. Substance that effects emotional and psychological perception in the brain.

PSYCHOACTIVE DRUGS. Any drug that affects the mind or behavior. There are five main classes of psychoactive drugs: opiates and opioids (e.g. heroin and methadone); stimulants (e.g. cocaine, nicotine), depressants (e.g. tranquilizers, antipsychotics, alcohol), hallucinogens (e.g. LSD), and marijuana and hashish.

PSYCHODYNAMIC PSYCHOTHERAPY. A less intensive form of insight-oriented therapy than psychoanalysis that typically involves greater interaction between therapist and patient than classical psychoanalysis.

PSYCHODYNAMIC THERAPY. A therapeutic approach that assumes dysfunctional or unwanted behavior is caused by unconscious, internal conflicts and focuses on gaining insight into these motivations.

PSYCHOGENIC. Referring to a disorder associated with mental or emotional conflict. At one time most stuttering was considered psychogenic, but recent research indicates that psychogenic stuttering is the least common form.

PSYCHOLOGICAL. Pertaining to the mind, its mental processes, and its emotional makeup.

PSYCHOLOGICAL TESTS. Written, verbal, or visual tasks that assess psychological functioning, intelligence, and/or personality traits.

PSYCHOLOGIST. A mental health professional who treats mental and behavioral disorders by support and insight to encourage healthy behavior patterns and personality growth. Psychologists also study the brain, behavior, emotions, and learning.

PSYCHOMOTOR AGITATION. Disturbed physical and mental processes (e.g., fidgeting, wringing of hands, racing thoughts); a symptom of major depressive disorder.

PSYCHOMOTOR RETARDATION. Slowed physical and mental processes (e.g., slowed thinking, walking, and talking); a symptom of major depressive disorder.

PSYCHOPATHOLOGY. A mental disorder or illness, such as schizophrenia, personality disorder, or major depressive disorder.

PSYCHOSIS. A serious mental disorder characterized by defective or lost contact with reality often with hallucinations or delusions.

PSYCHOSOCIAL. A term referring to the mind's ability to, consciously or unconsciously, adjust and relate the body to its social environment.

PSYCHOSOMATIC. Referring to physical symptoms that are caused or significantly influenced by emotional factors. Some doctors regard couvade syndrome as a psychosomatic condition.

PSYCHOSURGERY. Brain surgery performed to alleviate chronic psychological conditions such as obsessive-compulsive disorder (OCD), depression, and bipolar disorder.

PSYCHOTHERAPY. The treatment of mental and behavioral disorders by support and insight to encourage healthy behavior patterns and personality growth.

(c) 2011 Cengage Learning. All Rights Reserved.

PSYCHOTIC DISORDER. A mental disorder characterized by delusions, hallucinations, or other symptoms of lack of contact with reality. The schizophrenias are psychotic disorders.

PSYLLIUM HYDROPHILIC MUCILLOID. A plant material contained in some laxatives.

PUBERTY. Point in development when the gonads begin to function and secondary sexual characteristics begin to appear.

PUBIS. The anterior portion of the pelvis located in the anterior abdomen.

PULMONARY. Referring to the lungs and respiratory system.

PULMONARY ANGIOGRAPHY. An x-ray study of the lungs, performed by insertion of a catheter into a vein, through the heart, and into the pulmonary artery. Pulmonary angiography is performed to evaluate blood circulation to the lungs. It is also considered the most accurate diagnostic test for detecting a pulmonary embolism.

PULMONARY ARTERY. The blood vessel that delivers blood from the heart to the lungs.

PULMONARY EDEMA. A problem caused when fluid backs up into the veins of the lungs. Increased pressure in these veins forces fluid out of the vein and into the air spaces (alveoli). This interferes with the exchange of oxygen and carbon dioxide in the alveoli.

PULMONARY EMBOLISM. An obstruction of a blood vessel in the lungs, usually caused by a blood clot that blocks a coronary artery. Pulmonary embolism can be very serious and, in some cases, fatal.

PULMONARY FIBROSIS. A scarring process that is the end result of many forms of long-lasting lung disease.

PULMONARY FUNCTION TEST. A test that measures the capacity and function of the lungs as well as the blood's ability to carry oxygen. During the test, the patient breathes into a device called a spirometer.

PULMONARY HYPERTENSION. High blood pressure in the veins and arteries of the lungs.

PULMONARY NODULE. A lesion surrounded by normal lung tissue. Nodules may be caused by bacteria, fungi, or a tumor (benign or cancerous).

PULMONARY REHABILITATION. A program to treat COPD, which generally includes education and counseling, exercise, nutritional guidance, techniques to improve breathing, and emotional support.

PULMONARY VALVE. The heart valve that is positioned between the right ventricle and the opening into the pulmonary artery.

PULMONIC VALVE. A fold in the pulmonary artery that directs blood to the lungs. It may be transferred to replace a severely diseased aortic valve during heart valve replacement surgery for aortic stenosis.

PULP. The soft innermost layer of a tooth that contains its blood vessels and nerves.

PULP CHAMBER. The area within the tooth occupied by dental pulp.

PULPITIS. Inflammation of the pulp of a tooth that involves the blood vessels and nerves.

PULSE OXIMETRY. The noninvasive monitoring or determination of oxygen-hemoglobin saturation of the blood.

PUNCH BIOPSY. A method of obtaining skin samples under local anesthesia using a surgical skin punch.

PUNCTUM. Tiny opening at the inner corners of the upper and lower lids. The area for the beginning of tear drainage.

PUNCTURE. An injury caused by a sharp, narrow object deeply penetrating the skin.

PUPIL. The opening in the center of the iris that allows light to pass through to the retina.

PURGING. The use of vomiting, diuretics, or laxatives to clear the stomach and intestines after a binge.

PURIFIED PROTEIN DERIVATIVE (PPD). An extract of tubercle bacilli that is injected into the skin to find out whether a person presently has or has ever had tuberculosis.

PURINE. A white crystalline substance that is one of the building blocks of DNA. Uric acid is produced when purine is broken down in the body.

PURKINJE'S CELLS. Large branching cells of the nervous system.

PURPURA. A skin discoloration of purplish or brownish red spots caused by bleeding from broken capillaries.

PURULENT. Consisting of or containing pus.

PUS. A generally viscous, yellowish–white fluid formed in infected tissue, consisting of white blood cells, cellular debris, and dead tissue.

PUSTULE. A small elevation of the skin containing pus or cloudy tissue fluid.

(c) 2011 Cengage Learning. All Rights Reserved.

PUVA. A type of phototherapy that combines the oral or topical photosensitizing chemical psoralen with long-wave ultraviolet light A (UVA).

PYELONEPHRITIS. Bacterial inflammation of the upper urinary tract.

PYLORUS. The ring of muscle that controls the passage of material from the stomach into the small intestine.

PYODERMA. A pus-containing skin infection, such as impetigo, caused by *Staphylococcus* or group A *Streptococcus* bacteria.

PYOGENIC. Capable of generating pus. *Streptococcus*, *Staphocococcus*, and bowel bacteria are the primary pyogenic organisms.

PYOGENIC ARTHRITIS. Another name for infectious arthritis. Pyogenic means that pus is formed during the disease process.

PYRETHRIN, PYRETHROID. Naturally-occurring insecticide extracted from chrysanthemum flowers. It paralyzes lice so that they cannot feed.

PYREXIA. A medical term denoting fevers.

PYRIDOSTIGMINE BROMIDE (MESTINON). An anticholinesterase drug used in treating myasthenia gravis.

PYROGEN. A chemical circulating in the blood that causes a rise in body temperature.

PYROMANIA. An impulse control disorder in which one sets fires.

Q

Q-FEVER. A disease that is marked by high fever, chills and muscle pain. It is seen in North America, Europe, and parts of Africa. It may be spread by drinking raw milk, or by tick bites.

QI. Basic life energy, according to traditional Chinese medicine.

QRS. A pattern seen in an electrocardiogram that indicates the pulses in a heart beat and their duration. Variations from a normal QRS pattern indicate heart disease.

QUADRANTECTOMY. Removal of a quadrant, or about a quarter of the breast.

QUADRICEPS, HIP FLEXORS, HAMSTRINGS. Major muscles in the thigh area that affect knee mechanics.

QUADRIPLEGIA. Paralysis of all four limbs.

QUADRIVALENT VACCINE. A vaccine that protects against four pathogens.

QUANTIFIABLE. Can be expressed as a number. The results of quantifiable psychological tests can be translated into numerical values, or scores.

QUININE. One of the first treatments for malaria, quinine is a natural product made from the bark of the Cinchona tree. It was popular until being superseded by the development of chloroquine in the 1940s. In the wake of widespread chloroquine resistance, however, it has become popular again. Quinine, or its close relative quinidine, can be given intravenously to treat severe *Falciparum* malaria.

QV. Quantum vacuum, a theory coined by physicists, which defines the interactions of energy that combine to form reality.

R

RABIES. A rare but serious disease caused by a virus carried in saliva. It is transmitted when an infected animal bites a person.

RACHITIC ROSARY. Beadlike bumps present at the junction of the ribs with their cartilages; often seen in children with rickets.

RADIAL ARTERY. An artery located in the arm and used for bypass grafts.

RADIAL KERATOTOMY (RK). A surgical procedure involving the use of a diamond–tipped blade to make several spoke–like slits in the peripheral (non–viewing) portion of the cornea to improve the focus of the eye and correct myopia by flattening the cornea.

RADIATION THERAPY. Use of radioisotopes to kill tumor cells. Applied externally through a beam of x rays, intraoperatively (during surgery), or deposited internally by implanting radioactive seeds in tumor tissue.

RADICAL PROSTATECTOMY. Surgical removal of the entire prostate, a common method of treating prostate cancer.

RADICAL RESECTION. Surgical resection that takes the blood supply and lymph system supplying the organ along with the organ.

RADICULAR. Pain that is caused by the root of a nerve.

RADICULOPATHY. Sometimes referred to as a pinched nerve, it refers to compression of the nerve

(c) 2011 Cengage Learning. All Rights Reserved.

root–the part of a nerve between vertebrae. This compression causes pain to be perceived in areas to which the nerve leads.

RADIO WAVES. Electromagnetic energy of the frequency range corresponding to that used in radio communications, usually 10,000 cycles per second to 300 billion cycles per second. Radio waves are the same as visible light, x rays, and all other types of electromagnetic radiation, but are of a higher frequency.

RADIOACTIVE ISOTOPE. One of two or more atoms with the same number of protons but a different number of neutrons with a nuclear composition. In nuclear scanning, radioactive isotopes are used as a diagnostic agent.

RADIOCONTRAST AGENTS. Dyes administered to a patient for the purposes of a radiologic study.

RADIOFREQUENCY ABLATION (RFA). A procedure in which radiofrequency waves are used to destroy blood vessels and tissues.

RADIOGRAPH. The actual picture or film produced by an x-ray study.

RADIOGRAPHICALLY DENSE. An abundance of glandular tissue that results in diminished anatomic detail on the mammogram.

RADIOGRAPHY. Examination of any part of the body through the use of x rays. The process produces an image of shadows and contrasts on film.

RADIOISOTOPE. An unstable form of an element that gives off radiation to become stable.

RADIOLOGIST. A medical doctor specially trained in radiology (x ray) interpretation and its use in the diagnosis of diseases and injuries.

RADIONUCLIDE. A substance that emits radiation that can be detected by a scanner as the substance disintegrates.

RADIONUCLIDE BONE SCAN. A test that tells if cancer has spread to the bones.

RADIONUCLIDE SCANNING. Diagnostic test in which a radioactive dye is injected into the bloodstream and photographed to display internal vessels, organs and tissues.

RADIOPHARMACEUTICAL. A radioactive pharmaceutical or chemical (usually radioactive iodine or cobalt) used for diagnostic or therapeutic purposes.

RADIOSURGERY. A precise delivery of a large dose of radiation to a targeted area within the brain.

RADIOTHERAPY. The use of ionizing radiation, either as x rays or radioactive isotopes, to treat disease.

RANGE OF MOTION (ROM). The range of motion of a joint from full extension to full flexion (bending) measured in degrees like a circle.

RAPID CYCLING. Four or more manic, hypomanic, mixed, or depressive episodes within a 12-month period.

RAPID EYE MOVEMENT (REM) SLEEP. A phase of sleep during which the person's eyes move rapidly beneath the lids. It accounts for 20–25% of sleep time. Dreaming occurs during REM sleep.

RASH. A spotted, pink or red skin eruption that may be accompanied by itching and is caused by disease, contact with an allergen, food ingestion, or drug reaction.

RAYNAUD PHENOMENON/RAYNAUD DISEASE. A condition in which blood flow to the body's tissues is reduced by a malfunction of the nerves that regulate the constriction of blood vessels. When attacks of Raynaud's occur in the absence of other medical conditions, it is called Raynaud disease. When attacks occur as part of a disease (as in scleroderma), it is called Raynaud phenomenon.

REACTIVE ARTHRITIS. Another name for Reiter's syndrome.

REACTIVE STRESS TEST. A positive sign of fetal well being. The FHR rises at least 20 beats per minute above the baseline heart rate for at least 20 seconds, occurring at least twice in a 20-minute period.

REBOUND HEADACHE. A type of primary headache caused by overuse of pain relievers. It is also known as analgesic abuse headache.

RECEPTOR. A molecular structure in a cell or on the surface of a cell that allows binding of a specific substance that causes a specific physiologic response.

RECESSIVE GENE. A type of gene that is not expressed as a trait unless inherited by both parents.

RECESSIVE INHERITANCE. A pattern of inheritance where both parents carry the gene responsible for a trait or disease (although they seldom show symptoms). Their offspring will have a 25% chance of having the trait or disease. Recessive inheritance is also responsible for disorders such as hemophilia, where the mother carries the affected gene on the X chromosome and passes it to her son.

(c) 2011 Cengage Learning. All Rights Reserved.

RECESSIVE TRAIT. An inherited trait or characteristic that is outwardly obvious only when two copies of the gene for that trait are present.

RECIPIENT. A person who receives an organ transplant.

RECOMBINANT PROTEIN. A manipulated or modified form of a protein which results in the ability to produce the modified protein on a large scale.

RECOMMENDED DIETARY ALLOWANCE (RDA). Guidelines for the amounts of vitamins and minerals necessary for proper health and nutrition established by the National Academy of Sciences in 1989.

RECOMPRESSION. Restoring the elevated pressure of the diving environment to treat decompression sickness and gas embolism by decreasing bubble size.

RECTAL PROLAPSE. Protrusion of the rectal mucous membrane through the anus.

RECTOCELE. Bulging of the rectum into the vaginal wall.

RECTUM. The last few inches of the large intestine that store waste until it is eliminated from the body through the anus.

RECURRENT ABDOMINAL PAIN (RAP). Functional abdominal pain; stomachaches in children that recur at least once a month and that are not caused by an underlying medical condition.

RECURRENT CORNEAL EROSION (RCE). Repeated erosion of the cornea. May be a result of inadequate healing of a previous abrasion.

RECURRENT LARYNGEAL NERVE. One of two offshoots of the vagus nerve that connect to the larynx. It is located below the larynx.

RECURRENT ULCER. Peptic ulcers that flare up after healing. They may be caused a helicobacter pylori bacterial infection and are treated with a combination of antibiotics and gastric acid reducing medications, like proton pump inhibitors.

RED BLOOD CELL (RBC). Cell that contains hemoglobin (the molecule that transports oxygen) and help remove wastes from tissues throughout the body.

RED BLOOD CELL INDICES. Measurements that describe the size and hemoglobin content of red blood cells.

RED CELL DISTRIBUTION WIDTH (RDW). A measure of the variation in size of red blood cells.

REDUCIBLE HERNIA. A hernia that can be gently pushed back into place or that disappears when the person lies down.

REED-STERNBERG CELLS. Cancerous cells that, when present in the body, are indicative of Hodgkin's lymphoma.

REFERRED PAIN. The presence of pain in an area other than where it originates.

REFLEX. An involuntary response to a particular stimulus.

REFLEX SEIZURE. Seizure brought on by specific sensory stimuli.

REFLEXOLOGY. Belief that reflex areas in the feet correspond to every part of the body, including organs and glands, and that stimulating the correct reflex area can affect the body part.

REFLUX. An abnormal backward or return flow of a fluid.

REFLUX ESOPHAGITIS. Inflammation of the lower esophagus caused by the backflow of stomach contents.

REFRACTION. The bending of light rays as they pass from one medium through another. Used to describe the action of the cornea and lens on light rays as they enter they eye. Also used to describe the determination and measurement of the eye's focusing system by an optometrist or ophthalmologist.

REFRACTIVE ERROR. The inability of the eye to properly focus light due to an irregularly shaped cornea, resulting in blurry vision, nearsightedness, farsightedness, or astigmatism.

REFRACTIVE SURGERY. A surgical procedure that corrects visual defects by permanently changing the shape of the cornea.

REGRESSION. A return to earlier, particularly infantile, patterns of thought and behavior.

REGURGITATION. Flow of material back up the esophagus and into the throat or lungs.

REHYDRATION. The restoration of water or fluid to a body that has become dehydrated.

REITER'S SYNDROME. A group of symptoms that includes arthritis, inflammation of the urethra, and conjunctivitis, and develops as a late complication of infection with *Shigella flexneri*. The syndrome was first described by a German doctor named Hans Reiter in 1918.

(c) 2011 Cengage Learning. All Rights Reserved.

REJECTION. An immune response that occurs when a transplanted organ is viewed as a foreign substance by the body. If left untreated, rejection can lead to organ failure and even death.

RELAPSE. A recurrence of symptoms after a period of improvement or recovery.

RELAPSING-REMITTING. A pattern of symptoms of multiple sclerosis in which symptomatic attacks occur that last 24 hours or more, followed by complete or almost complete improvement.

RELAXATION RESPONSE. The human body's response to relaxation techniques, during which metabolism and stress levels decrease and immune response increases.

RELAXATION TECHNIQUE. A technique used to relieve stress. Exercise, biofeedback, hypnosis, and meditation are all effective relaxation tools. Relaxation techniques are used in cognitive-behavioral therapy to teach patients new ways of coping with stressful situations.

REM LATENCY. After a person falls asleep, the amount of time it takes for the first onset of REM (rapid eye movement) sleep.

REMEDY ANTIDOTE. Certain foods, beverages, prescription medications, aromatic compounds, and other environmental elements that counteract the efficacy of homeopathic remedies.

REMISSION. A disappearance of a disease as a result of treatment. Complete remission means that all disease is gone. Partial remission means that the disease is significantly improved by treatment, but residual traces of the disease are still present.

REMODELING. The ongoing process of bone formation and breakdown that results in healthy bone development.

RENAL. Relating to the kidneys, from the Latin word *renes*.

RENAL AGENESIS. Failure of the fetal kidneys to form. Oligohydramnios usually associated with absence of both kidneys.

RENAL ARTERY ANEURYSM. An aneurysm relating to, involving, or located in the region of the kidneys.

RENAL ARTERY STENOSIS. Narrowing or constriction of the artery that supplies the kidney with blood.

RENAL CELL CARCINOMA. Cancer of the kidney.

RENAL DISEASE. Kidney disease.

RENAL FAILURE. Disorder characterized by the kidney's inability to filter wastes from the blood. It may be acute (occuring suddenly and usually reversable) or chronic (developing slowly over time as a result of permanent damage).

RENAL ULTRASOUND. A painless and non-invasive procedure in which sound waves are bounced off the kidneys. These sound waves produce a pattern of echoes that are then used by the computer to create pictures of areas inside the kidney (sonograms).

RENIN. An enzyme produced in the kidneys that controls the activation of the hormone angiotensin, which stimulates the adrenal glands to produce aldosterone.

REPERFUSION THERAPY. Restoration of blood flow to an organ or tissue; following a heart attack, quickly opening blocked arteries to reperfuse the heart muscles to minimize damage.

REPETITIVE STRESS INJURY; REPETITIVE STRAIN INJURY (RSI). Any of various musculoskeletal disorders—such as tendonitis or carpal tunnel syndrome—that are caused by cumulative damage to muscles, tendons, ligaments, nerves, or joints from highly repetitive movements, such as of the hand, wrist, arm, or shoulder.

REPRESENTATIVE SAMPLE. A random sample of people that adequately represents the test-taking population in age, gender, race, and socioeconomic standing.

REPRESSION. A unconscious psychological mechanism in which painful or unacceptable ideas, memories, or feelings are removed from conscious awareness or recall.

REPRODUCTIVE ORGANS. The group of organs (including the testes, ovaries, and uterus) whose purpose is to produce a new individual and continue the species.

RESECT; RESECTION. To remove surgically.

RESECTABLE CANCER. A tumor that can be surgically removed.

RESERPINE (SERPASIL). A drug prescribed for high blood pressure.

RESERVOIR. A population in which a virus is maintained without causing serious illness to the infected individuals.

RESIDUE. Traces that remain after most of the rest of the material is gone.

RESORBED. Absorbed by the body because of lack of function. This happens to the jawbone after tooth loss.

(c) 2011 Cengage Learning. All Rights Reserved.

RESPIRATION. Respiration is the process by which nutrients (specifically sugar, or glucose) and oxygen are taken in to a cell; chemical reactions take place; energy is produce and stored; and carbon dioxide and wastes are given off.

RESPIRATORY. Referring to breathing in and breathing out, and the function of the lungs.

RESPIRATORY DISTRESS. A condition in which patients with lung disease are not able to get enough oxygen.

RESPIRATORY DISTRESS SYNDROME (RDS). Condition in which a premature infant with immature lungs does not develop surfactant, a protective film that helps air sacs in the lungs to stay open. RDS is the most common problem seen in premature infants.

RESPIRATORY TRACT. The air passages from the nose to the air sacs of the lungs, including the pharynx, larynx, trachea, and bronchi.

RESPITE CARE. Temporary care of a patient to provide parents or other caregivers with a period of physical, mental, and emotional rest.

RESTENOSIS. The narrowing of a blood vessel after it has been opened, usually by balloon angioplasty.

RESTLESS LEGS SYNDROME (RLS). A neurological disorder characterized by aching, burning, or creeping sensations in the legs and an urge to move the legs, often resulting in insomnia.

RESUSCITATION. Reviving an unconscious person or restoring breathing.

RETAINER. An orthodontic appliance that is worn to stabilize teeth in a new position.

RETENTION TREATMENT STAGE. The passive treatment period following orthodontic treatment, when retainers may be used to stabilize the teeth.

RETICULOCYTE. An early, immature form of a red blood cell. Over time, the reticulocyte develops to become a mature, oxygen-carrying red blood cell.

RETINA. The inner, light-sensitive layer of the eye containing rods and cones; transforms the image it receives into electrical messages sent to the brain via the optic nerve.

RETINAL DETACHMENT. A serious vision disorder in which the light-detecting layer of cells inside the eye (retina) is separated from its normal support tissue and no longer functions properly.

RETINAL HEMORRHAGE. Bleeding in the back of the eye.

RETINOBLASTOMA. A hereditary malignant tumor of the retina that develops during childhood.

RETINOIC ACID. Vitamin A_1 acid which is used topically to treat acne.

RETINOID. A synthetic vitamin A derivative used in the treatment of a variety of skin disorders.

RETINOL. Another name for vitamin A.

RETINOPATHY OF PREMATURITY. A condition in which the blood vessels in a premature infant's eyes do not develop normally, and can, in some cases, result in blindness.

RETINOSCOPE. An instrument for determining the state of refraction of the eye by illuminating the retina with a mirror.

RETRACTOR. An instrument used during surgery to hold an incision open and pull back underlying layers of tissue.

RETROGRADE EJACULATION. A condition in which the semen spurts backward into the bladder.

RETROGRADE MENSTRUATION. Menstrual flow that travels into the body cavity rather than being expelled through the uterus.

RETROGRADE PYELOGRAM. A pyelography or x-ray technique in which a dye is injected into the kidneys through the ureters.

RETROPUBIC URETHROPEXY. A generic term for the Burch procedure and its variants that treat mild stress incontinence by stabilizing the urethra with retropubic surgery.

RETROVIRUS. A family of RNA viruses containing a reverse transcriptase enzyme, which allows the viruses' genetic information to become part of the genetic information of the host cell upon replication.

REVERSE TRANSCRIPTION-POLYMERASE CHAIN REACTION; RT-PCR. A method of polymerase-chain-reaction amplification of nucleic acid sequences that uses RNA as the template for transcribing the corresponding DNA using reverse transcriptase.

REYE'S SYNDROME. A life-threatening disease that affects the liver and the brain and sometimes occurs after a viral infection, such as flu or chickenpox. Children or teenagers who are given aspirin for flu or chickenpox are at increased risk of developing Reye's syndrome.

RH (RHESUS) FACTOR. An antigen present in the red blood cells of 85% of humans. A person with Rh factor is Rh positive (Rh+); a person without it is

(c) 2011 Cengage Learning. All Rights Reserved.

Rh negative (Rh-). The Rh factor was first identified in the blood of a rhesus monkey.

RH BLOOD INCOMPATIBILITY. A blood type problem between mother (who is Rh negative) and baby (who is Rh positive), making the immune system of the mother attack her unborn baby. During delivery of the first pregnancy, the mother's immune system becomes sensitive to the Rh positive blood of the baby. The mother's system may then attack later pregnancies and cause severe illness or death to those babies.

RH BLOOD TYPE. Blood type based on the presence or absence of the D antigen on the red blood cells.

RH DISEASE. The Rh factor is a genetically determined antigen on red blood cells that produce immune responses. If an Rh-negative woman is pregnant with an Rh-positive fetus, her body will produce antibodies against the fetus's blood, causing Rh disease.

RH NEGATIVE. Lacking the Rh factor, genetically determined antigens in red blood cells that produce immune responses.

RH SENSITIZATION. A woman with a negative blood type (Rh negative) who has produced antibodies against her fetus with a positive blood type (Rh positive). The mother's body considered the fetal blood cells a foreign object and mounted an immune attack on it. Rh immune globulin (RhoGAM) is a vaccine that must be given to a woman after an abortion, miscarriage, or prenatal tests in order to prevent sensitization to Rh disease.

RHABDOID. Rod- or wand-shaped, like the first stage of the threadworm larva.

RHABDOVIRUS. A type of virus named for its rod- or bullet-like shape. The rabies virus belongs to a family of viruses called Rhabdoviridae.

RHEUMATIC DISEASE. A type of disease involving inflammation of muscles, joints, and other tissues.

RHEUMATIC FEVER. A disease that causes inflammation in various body tissues. Rare in most developed countries, but reported to be on the increase in parts of the United States. Joint inflammation occurs, but more serious is the frequency with which the disease permanently damages the heart. The nervous system may also be affected, causing Sydenham's chorea.

RHEUMATIC HEART DISEASE. A condition caused by a streptococcus infection which can result in permanent heart damage.

RHEUMATOID ARTHRITIS. A joint disease of unknown origins that may begin at an early age, causing deformity and loss of function in the joints.

RHEUMATOID FACTOR (RF). An antibody present in the blood serum of many individuals affected by rheumatoid arthritis.

RHEUMATOLOGIST. Physician specializing in the diagnosis and treatment of arthritis and related conditions.

RHEUMATOLOGY. The branch of medicine that specializes in the diagnosis and treatment of disorders affecting the muscles and joints.

RHINITIS. An inflammation of the mucous membranes that line the nasal passages.

RHINOPHYMA. Long-term swelling and overgrowth in skin tissue of the nose that leaves it with a knobby bulb-like look.

RHINOPLASTY. Plastic surgery of the nose to repair or change the shape of the nose.

RHINORRHEA. A name for the common cold.

RHINOVIRUS. A virus that infects the upper respiratory system and causes the common cold.

RHYTHM METHOD. The oldest method of contraception, in which partners periodically refrain from having sex during ovulation. This method has a high failure rate.

RHYTIDECTOMY. It literally means "wrinkle excision." It is another term for face lift surgery.

RIBAVIRIN. A drug that is used to combat viral infections.

RICKETS. A condition caused by the dietary deficiency of vitamin D, calcium, and usually phosphorus, seen primarily in infancy and childhood, and characterized by abnormal bone formation.

RICKETTSIA. A rod-shaped infectious microorganism that can reproduce only inside a living cell. Scrub typhus is a rickettsial disease.

RIGHT-HEART CARDIAC CATHERIZATION. A medical procedure during which a physician threads a catheter into the right side of the heart to measure the blood pressure in the right side of the heart and the pulmonary artery. The right heart's pumping ability can also be evaluated.

RINGWORM. A fungal infection of the skin, usually known as tinea corporis.

(c) 2011 Cengage Learning. All Rights Reserved.

RINNE TEST. A hearing test using a vibrating tuning fork which is held near the ear and held at the back of the skull.

ROD. Photoreceptor that is highly sensitive to low levels of light and transmits images in shades of gray.

ROLFING. Based on the belief that proper alignment of various parts of the body is necessary for physical and mental health, rolfing uses deep tissue massage and movement exercises in an attempt to bring the body into correct alignment.

ROOT CANAL. The space within a tooth that runs from the pulp chamber to the tip of the root.

ROOT CANAL TREATMENT. The process of removing diseased or damaged pulp from a tooth, then filling and sealing the pulp chamber and root canals.

RORSCHACH TEST. A well–known projective test that requires the patient to describe what he or she sees in each of 10 inkblots. It is named for the Swiss psychiatrist who invented it.

ROSACEA. A chronic skin disease characterized by persistent redness of the skin and periodic outbreaks of pustules, usually affecting the middle third of the face.

ROSE SPOTS. Small slightly raised reddish pimples that are a distinguishing feature of typhoid or paratyphoid infection.

ROTABLATION. A nonsurgical technique for treating diseased arteries in which a special catheter with a diamond-coated tip is guided to the point of narrowing in the artery. The catheter tip spins at high speed and grinds away the blockage or plaque on the artery walls.

ROTAVIRUS. Any virus of the genus *Rotavirus,* some of which cause gastroenteritis.

ROULEAUX. The stacking up of red blood cells, caused by extra or abnormal proteins in the blood that decrease the normal distance red cells maintain between each other.

ROUNDWORM. Any round-bodied unsegmented worm as distinguished from a flatworm. Also called a nematode, they look similar to the common earthworm.

RUBELLA. A contagious viral disease that is milder than typical measles but is damaging to the fetus when it occurs early in pregnancy. Also called German measles.

RUPTURE. A tear or break in body tissue of an organ.

RUSSELL'S SIGN. Scraped or raw areas on the patient's knuckles, caused by self-induced vomiting.

S

SACCULAR ANEURYSM. A type of aneurysm that resembles a small sack of blood attached to the outer surface of a blood vessel by a thin neck.

SACRAL NERVES. The five pairs of nerves that arise from the lowermost segments of the spinal cord and control bladder, bowel, and pelvic functions. Stimulation of the sacral nerves by an implanted device is a newer treatment for urinary incontinence.

SACROCOCCYGEAL TERATOMA (SCT). A tumor occurring at the base of the fetus's tailbone.

SACRUM. Posterior bony wall of the pelvis.

SADISM. Sexual arousal through inflicting pain on another person.

SALICYLATES. A group of drugs that includes aspirin and related compounds. Salicylates are used to relieve pain, reduce inflammation, and lower fever.

SALICYLIC ACID. An agent prescribed in the treatment of hyperkeratotic skin conditions and fungal infections.

SALINE. A salt solution in water. Normal saline has the same salt concentration as the body, 0.9%.

SALIVARY DUCT. Tube through which saliva is carried from the salivary gland to the mouth.

SALIVARY GLAND. Three pairs of glands that secrete into the mouth and aid digestion.

SALMONELLOSIS. Food poisoning; an infection by bacteria of the genus *Salmonella* that usually causes severe diarrhea and may be transmitted to the fetus.

SALPINGITIS. Inflammation of the fallopian tube.

SALVAGE THERAPY. Treatment measures taken late in the course of a disease after other therapies have failed. It is also known as rescue therapy.

SAMANA. Life sustaining energy of the smaller intestine; the fourth of the five airs of Ayurvedic philosophy; the life force governing side-to-side motion.

SAPHENOUS VEIN. A long vein in the thigh or calf commonly used for bypass grafts.

SARCOIDOSIS. A chronic disease that causes formation of abnormal areas containing inflammatory cells, called granulomas, in any organ or tissue; in

(c) 2011 Cengage Learning. All Rights Reserved.

the heart, large areas of the heart muscle can be involved, causing cardiomyopathy.

SARCOMA. A type of cancer that originates from connective tissue such as bone or muscle.

SARGRAMOSTIM. A medication made from yeast that stimulates WBC production. It is sold under the trade names Leukine and Prokine.

SATURATED FAT. Found mainly in meat and dairy products but also in vegetable sources such as some nuts, seeds, and avocados.

SCABIES. A contagious parasitic skin disease characterized by intense itching.

SCHEMAS. Fundamental core beliefs or assumptions that are part of the perceptual filter people use to view the world. Cognitive-behavioral therapy seeks to change maladaptive schemas.

SCHEUERMANN'S DISEASE. Juvenile kyphosis due to damaged bone in the spinal vertebrae.

SCHIZOAFFECTIVE DISORDER. Schizophrenic symptoms occurring concurrently with a major depressive and/or manic episode.

SCHIZOPHRENIA. A severe mental illness in which a person has difficulty distinguishing what is real from what is not real. It is often characterized by hallucinations, delusions, and withdrawal from people and social activities.

SCHIZOPHRENIFORM DISORDER. A short-term variation of schizophrenia that has a total duration of one to six months.

SCHWANNOMA. A tumor derived from the cells of the myelin sheath that surrounds many nerve cells.

SCIATICA. Pain that radiates along the sciatic nerve, extending from the buttock down the leg to the foot.

SCINTIGRAM. A nuclear angiogram; a scintigram involves injection of a radioactive substance into the patient's circulatory system. As the substance travels through the body, a special scanning camera takes pictures.

SCINTILLATION OR GAMMA CAMERA. A camera, somewhat like an x-ray machine, used to photograph internal organs after the patient has been injected with a radioactive material.

SCLERA. The tough, fibrous, white outer protective covering that surrounds the eye.

SCLERODERMA. A disease that first affects the skin and later affects certain internal organs. The first symptoms are the hardening, thickening, and shrinking of the skin.

SCLEROSANT. An irritating solution that stops bleeding by hardening the blood or vein it is injected into.

SCLEROSIS. Hardening.

SCOLIOMETER. A tool for measuring trunk asymmetry; it includes a bubble level and angle measure.

SCOLIOSIS. An abnormal, side-to-side curvature of the spine.

SCOTOMA. An area of lost or depressed vision within the visual field surrounded by an area of normal vision. Survivors of retinoblastoma frequently develop scotomas.

SCREENING. Process through which carriers of a trait may be identified within a population.

SCROTUM. The pouch of skin containing the testes, epididymis, and portions of the spermatic cords.

SCURVY. A nutritional disorder resulting from a deficiency of vitamin C that causes skin bruising and hemorrhages.

SEALANT. A thin plastic substance that is painted over teeth as an anti-cavity measure to seal out food particles and acids produced by bacteria.

SEALED RADIOACTIVE SOURCES. A radioactive source which is contained or sealed within a ribbon, wire, needle, balloon, tube or catheter.

SEASONAL AFFECTIVE DISORDER (SAD). A mood disorder characterized by depression during the winter months.

SEBACEOUS FOLLICLES. Structures in the skin that contain oil-producing glands and hair follicles and which give rise acne.

SEBACEOUS GLANDS. Tiny structures in the skin that produce oil (sebum). If they become plugged, sebum collects inside and forms a nurturing place for germs to grow.

SEBUM. An oily or waxy substance secreted by certain glands in the skin that protects hair and skin against fungi and some bacteria.

SECONDARY GAIN. The social, occupational, or interpersonal advantages that a patient derives from symptoms. A patient's being relieved of his or her

(c) 2011 Cengage Learning. All Rights Reserved.

share of household chores by other family members would be an example of secondary gain.

SECONDARY INFECTION. An infection by a microbe that occurs because the body is weakened by a primary infection caused by a different kind of microbe; also called an opportunistic infection.

SECONDARY POLYCYTHEMIA. Secondary polycythemia occurs when the excess of red blood cells is caused by a condition other than polycythemia vera. For example, when low levels of oxygen in the blood stimulate the bone marrow to produce more red blood cells, as in chronic lung disease.

SECONDARY PROGRESSIVE. A pattern of symptoms of multiple sclerosis in which there are relapses and remissions, followed by more steady progression of symptoms.

SECRETION. A substance, such as saliva or mucus, that is produced and given off by a cell or a gland.

SEDATIVE. Medicine that has a calming effect and may be used to treat nervousness or restlessness.

SEDENTARY. Inactivity and lack of exercise; a lifestyle that is a major risk factor for becoming overweight or obese and developing chronic diseases.

SEIZURE. A sudden attack, spasm, or convulsion.

SELECTIVE REDUCTION. Typically referred to in cases of multifetal pregnancy, when one or more fetuses are aborted to preserve the viability of the remaining fetuses and decrease health risks to the mother.

SELECTIVE SEROTONIN REUPTAKE INHIBITORS (SSRIS). A class of antidepressants that work by blocking the reabsorption of serotonin in brain cells, raising the level of the chemical in the brain. SSRIs include Prozac, Zoloft, Luvex, and Paxil.

SELENIUM. A mineral needed in extremely small quantities by the body. Large amounts can be very toxic.

SELF-DELIVERANCE. Another term for assisted suicide, more commonly used in Great Britain than in the United States.

SELF-LIMITED. A disease that runs its course without the need for professional medical treatment.

SEMEN. The thick whitish liquid released from the penis during sexual intercourse. It contains sperm and other secretions.

SEMICIRCULAR CANALS. Structures of the inner ear that help in maintaining balance.

SENESCENCE. Aging.

SENSITIVITY TEST. A test that determines which antibiotics will kill the bacteria that has been isolated from a culture.

SENSORINEURAL HEARING LOSS. Hearing loss caused by damage to the nerves or parts of the inner ear governing the sense of hearing.

SENSORY AWARENESS. Bringing attention to the sensations of tension and/or release in the muscles.

SENSORY DEPRIVATION. A situation where an individual finds himself in an environment without sensory cues. Also, (used here) the act of shutting one's senses off to outside sensory stimuli to achieve hallucinatory experiences and/or to observe the psychological results.

SENSORY INTEGRATION DYSFUNCTION. A neurological disorder in which a person has trouble processing and integrating all the information relayed to the brain by the various senses. Some researchers think that it is a possible cause of selective mutism.

SENSORY NERVES. Nerves that convey impulses from sense organs to the higher parts of the nervous system, including the brain.

SENTINEL LYMPH NODE. The first lymph node to receive lymph fluid from a tumor. If the sentinel node is cancer free, then it is likely that the cancerous cells have not metastasized.

SENTINEL NODE BIOPSY. A newer procedure performed in order to determine whether breast cancer has spread to auxiliary (underarm) lymph nodes.

SEPSIS. An overwhelming infection with effects throughout the body.

SEPTAL. Relating to the ventricular septum, the thin muscle wall dividing the right and left sides of the heart.

SEPTAL DEFECTS. These are holes in the septum, the muscle wall separating the right and left sides of the heart. Atrial septal defects are openings between the two upper heart chambers and ventricular septal defects are openings between the two lower heart chambers.

SEPTAL HEMATOMA. A mass of extravasated blood that is confined within the nasal septum.

SEPTIC. Referring to the presence of infection.

SEPTIC ARTHRITIS. Another name for infectious arthritis.

(c) 2011 Cengage Learning. All Rights Reserved.

SEPTIC SHOCK. A life-threatening drop in blood pressure caused by bacterial infection.

SEPTICEMIA. The medical term for blood poisoning, in which bacteria have invaded the bloodstream and circulates throughout the body.

SEPTUM (NASAL). The dividing partition in the nose that separates the two nostrils. It is composed of bone and cartilage.

SEPTUM (VENTRICULAR). That portion of the heart wall that divides the right and left ventricles.

SEQUESTRATION. A process in which the spleen withdraws some normal blood cells from circulation and holds them in case the body needs extra blood in an emergency.

SERIAL CASTING. A series of casts designed to gradually move a limb into a more functional position.

SERIAL MEASUREMENTS. A series of measurements looking for an increase or decrease over time.

SERIAL MONITORING. Monitoring of results of several blood tests over time to detect a pattern of increasing, decreasing, or unchanging values in the blood.

SERIAL X RAYS. A number of x rays performed at set times in the disease progression or treatment intervals. The radiographs will be compared to one another to track changes.

SEROCONVERSION. The development of detectable specific antibodies in a patient's blood serum as a result of infection or immunization.

SEROLOGICAL TESTS. Tests of immune function that are performed using the clear yellow liquid part of blood.

SEROLOGY. The analysis of the contents and properties of blood serum.

SEROSITIS. Inflammation of a serosal membrane. Polyserositis refers to the inflammation of two or more serosal membranes.

SEROTONIN. 5-Hydroxytryptamine; a substance that occurs throughout the body with numerous effects including neurotransmission in the brain. Inadequate amounts of serotonin are implicated in some forms of depression, obsessive-compulsive disorder, and anxiety disorders.

SEROTONIN DOPAMINE ANTAGONIST (SDA). The newer second-generation antipsychotic drugs, also called atypical antipsychotics. SDAs include clozapine (Clozaril), risperidone (Risperdal), and olanzapine (Zyprexa).

SEROTONIN SYNDROME. A group of symptoms caused by severely elevated serotonin levels in the body.

SEROTYPE. Microorganisms differing in the type of surface antigens.

SERTRALINE. An SSRI that is used to treat mental depression and a variety of other disorders.

SERUM (PLURAL, SERA). The clear fluid that separates from blood when the blood is allowed to clot completely. Blood serum can also be defined as blood plasma from which fibrinogen has been removed.

SERUM GASTRIN TEST. A laboratory test that is performed on a blood sample to determine that level of the hormone gastrin. High levels of gastrin indicate the presence a duodenal ulcer or a gastrinoma.

SERUM REAGENTS. Serum is fluid, or the fluid portion of the blood retained after removal of the blood cells and fibrin clot. Reagents are substances added to the serum to produce a chemical reaction.

SEX HORMONES. Hormones that are responsible for sexual characteristics and reproductive functioning.

SEX-LINKED. Refers to genes or traits carried on one of the sex chromosomes, usually the X.

SEX-LINKED GENETIC DISORDER. A disease or disorder caused by a gene mutation located on the X (female) or Y (male) chromosome.

SEXUAL ABUSE. When an individual is forced to engage in sexual activity by use of threats or other fear tactics, or instances in which an individual is physically unable to refuse.

SEXUAL ANHEDONIA. The inability to experience sexual pleasure.

SEXUAL AROUSAL DISORDER. The inhibition of the general arousal aspect of sexual response.

SEXUAL ASSAULT NURSE EXAMINER (SANE). A registered nurse who is trained to collect and document evidence from a sexual assault victim, evaluate and treat for STDs and pregnancy, and refer victims to follow-up medical care and counseling.

SEXUALLY TRANSMITTED DISEASE (STD). A disease that is passed from one person to another through sexual intercourse or other intimate sexual contact; also referred to as a sexually transmitted infection (STI).

SÉZARY SYNDROME. A leukemic phase of CTCL that develops in some patients, characterized by the appearance of malignant T cells in the peripheral blood and

(c) 2011 Cengage Learning. All Rights Reserved.

sometimes in the lymph nodes. The syndrome is named for Alfred Sézary (1880-1956), a French dermatologist.

SHARED PSYCHOTIC DISORDER. Also known as folie à deux; shared psychotic disorder is an uncommon disorder in which the same delusion is shared by two or more individuals.

SHAVE BIOPSY. A method of removing a sample of skin lesion so it can be examined by a pathologist. A scalpel or razor blade is held parallel to the skin's surface and is used to slice the lesion at its base.

SHEEP BLOOD AGAR PLATE. A petri dish filled with a nutrient gel containing red blood cells that is used to detect the presence of streptococcal bacteria in a throat culture. Streptococcal bacteria will lyse or break the red blood cells, leaving a clear spot around the bacterial colony.

SHIATSU. Japanese form of acupressure massage.

SHINGLES. A disease caused by an infection with the Herpes zoster virus, the same virus that causes chickenpox. Symptoms of shingles include pain and blisters along one nerve, usually on the face, chest, stomach, or back.

SHOCK. An abnormal condition resulting from low blood volume due to hemorrhage or dehydration. Signs of shock include rapid pulse and breathing, and cool, moist, pale skin.

SHOCK WAVE THERAPY. A method of treating tennis elbow and other musculoskeletal injuries that involves directing bursts of high-pressure sound waves at the affected area.

SHORT BOWEL SYNDROME. A condition in which the bowel is not as long as normal, either because of surgery or because of a congenital defect. Because the bowel has less surface area to absorb nutrients, it can result in malabsorption syndrome.

SHUNT. A passageway (or an artificially created passageway) that diverts blood flow from one main route to another.

SIALOGOGUE. A medication given to increase the flow of saliva.

SIBUTRAMINE. An appetite-suppressing drug that may increase the activity of norepinephrine and serotonin in the brain.

SICK BUILDING SYNDROME. An illness related to MCS in which a person develops symptoms in response to chronic exposure to airborne environmental chemicals found in a tightly sealed building.

SICKLE CELL. A red blood cell that has assumed an elongated shape due to the presence of hemoglobin S.

SICKLE CELL DISEASE. An inherited disorder characterized by a genetic flaw in hemoglobin production. (Hemoglobin is the substance within red blood cells that enables them to transport oxygen.) The hemoglobin that is produced has a kink in its structure that forces the red blood cells to take on a sickle shape, inhibiting their circulation and causing pain. This disorder primarily affects people of African descent.

SIDEROBLASTIC ANEMIA. Disorder in which the body has adequate iron but is unable to incorporate it into hemoglobin.

SIDEROPHILIN. Another name for transferrin.

SIGMOID COLON. The final portion of the large intestine that empties into the rectum.

SIGMOIDOSCOPY. A process of passing a long, hollow tubular instrument through the anus in order to permit inspection, diagnosis, treatment, and imaging, especially of the sigmoid colon.

SILENT REFLUX. An acid reflux problem that does not have marked symptoms but can cause chronic, recurrent respiratory symptoms much like asthma.

SILICOSIS. A progressive disease that results in impairment of lung function and is caused by inhalation of dust containing silica.

SINGLET OXYGEN. A highly reactive form of the oxygen molecule (O_2) formed during PDT that helps to destroy cancer cells by attacking their cell membranes.

SINGLETON. A fetus that develops alone in the uterus.

SINOATRIAL NODE (SAN). The heart's natural pacemaker, a group of cells located in the wall of the right atrium (upper chamber) of the heart near the entry of the superior vena cava, a major vein that carries deoxygenated blood from the upper part of the body to the heart.

SINUS TRACT. A narrow, elongated channel in the body that allows the escape of fluid.

SINUSES. Cavities or hollow areas.

SINUSITIS. Inflammation of the paranasal sinuses because of allergic reactions or viral, bacterial, or functional infections.

SITZ BATH. A hydrotherapy treatment for soaking the pelvic or genital areas.

(c) 2011 Cengage Learning. All Rights Reserved.

SJÖGREN'S SYNDROME. A connective tissue disease that hinders the production of tears and other body fluids.

SKELETAL MUSCLES. Muscles that move the skeleton. All of the muscles under voluntary control are skeletal muscles.

SKENE'S GLANDS. These are the glands of the female urethra.

SKIN APPENDAGES. Structures related to the integument such as hair follicles and sweat glands.

SKIN CONTRACTURE. A permanent tightening of the skin that prevents normal movement of the associated body part and that can cause permanent deformity.

SKIN GRAFTING. A technique in which a piece of healthy skin from the patient's body (or a donor's) is used to cover another part of the patient's body that has lost its skin.

SKIN HEMATOMA. Blood from a broken blood vessel that has accumulated under the skin.

SKIN TAG. A small outgrowth of skin tissue that may be smooth or irregular, flesh-colored and benign.

SLEEP APNEA. A condition marked by loud snoring during sleep and periodic episodes of suspended breathing.

SLEEP DISORDER. Any condition that interferes with sleep.

SLEEP LATENCY. The amount of time that it takes to fall asleep. Sleep latency is measured in minutes and is important in diagnosing depression.

SLEEP PARALYSIS. An abnormal episode of sleep in which the patient cannot move for a few minutes, usually occurring on falling asleep or waking up. Often found in patients with narcolepsy.

SLIT LAMP. An instrument that combines a binocular microscope with special lights. It allows an eye doctor to examine the front portion of the eye.

SMALL BOWEL OBSTRUCTION; SBO. An obstruction of the small intestine that prevents the free passage of material; sometimes caused by postoperative adhesions.

SMALL INTESTINE. Consists of three sections: duodenum (nearest the stomach), jejunum, and ileum (nearest the colon or large intestine). Different nutrients are absorbed in different sections of the small intestine.

SMALL-FOR-GESTATIONAL-AGE (SGA). A term used to describe newborns who are below the 10th percentile in height or weight for their estimated gestational age.

SMALLPOX. A highly contagious viral disease characterized by fever, weakness, and skin eruption with pustules that form scabs that slough off leaving scars.

SMEAR. A specimen prepared for microscopic study by spreading the material across a slide and treating it with a specific stain.

SMEAR LAYER. A layer of organic and inorganic material produced on teeth by dental instrumentation that may also contain bacteria and their by-products.

SMOOTH MUSCLES. Muscles that surround the linings of the digestive system, airways, and circulatory system.

SOCIAL PHOBIA. Fear of being judged or ridiculed by others; fear of being embarrassed in public.

SOCIALIZATION. Process by which new members are integrated into a social group.

SOFT PALATE. The structure at the roof of the mouth that separates the mouth and the pharynx.

SOLUTE. Solid substances that are dissolved in liquid in order to make a solution.

SOLUTION-FOCUSED THERAPY. A type of therapy that involves concrete goals and an emphasis on future direction rather than past experiences.

SOMATIC CELLS. All the cells of the body with the exception of the egg and sperm cells.

SOMATIZATION DISORDER. A chronic condition in which psychological stresses are converted into physical symptoms.

SOMATOFORM DISORDER. A category of psychiatric disorder characterized by physical complaints that appear to be medical in origin but that cannot be explained in terms of a physical disease, the results of substance abuse, or by another mental disorder.

SOMNAMBULISM. Another term for sleepwalking.

SONOGRAM. The picture formed by the pattern of echoes from an ultra sound.

SORE. An open wound, bruise, or lesion on the skin.

SPACE MAINTAINER. An orthodontic appliance that is worn to prevent adjacent teeth from moving into the space left by an unerupted or prematurely lost tooth.

SPASM. Sudden, involuntary tightening or tensing of a muscle or a group of muscles.

(c) 2011 Cengage Learning. All Rights Reserved.

SPASTIC. A condition in which the muscles are rigid, posture may be abnormal, and fine motor control is impaired.

SPASTICITY. Increased muscle tone, or stiffness, which leads to uncontrolled, awkward movements.

SPECIFICITY. A test's ability to detect only the disease in question.

SPECULUM. An instrument for enlarging the opening of any canal or cavity in order to facilitate inspection of its interior.

SPENT PHASE. A late development in polycythaemia vera leading to failure of the bone marrow and severe anemia.

SPERM. The reproductive cell of the male, which contains genetic information and participates in the act of fertilization of an ovum.

SPERM GRANULOMA. A collection of fluid that leaks from an improperly sealed or tied vas deferens. They usually disappear on their own, but can be drained if necessary.

SPERMATOGENESIS. The process by which sperm develop to become mature sperm, capable of fertilizing an ovum.

SPERMICIDE. A substance that kills sperm.

SPF. Sun protection factor; a number assigned to sunscreens that indicates the amount of UV-B radiation that is required to produce sunburn in the presence of the sunscreen, relative to the amount of UV-B radiation required to burn unprotected skin.

SPHINCTER. A circular band of muscle that surrounds an opening or passage in the body and narrows or closes the opening by contracting.

SPIKE WAVE DISCHARGE. Characteristic abnormal wave pattern in the electroencephalogram that is a hallmark of an area that has the potential of generating a seizure.

SPINA BIFIDA. Myelomeningocele; a congenital defect in which the fetal backbone and spinal canal do not close completely, allowing the spinal cord and its surrounding membranes to protrude.

SPINAL CANAL. The cavity or hollow space within the spine that contains cerebrospinal fluid.

SPINAL CORD. Elongated nerve bundles that lie in the vertebral canal and from which the spinal nerves emerge.

SPINAL FUSION. An operation in which the bones of the lower spine are permanently joined together using a bone graft obtained usually from the hip.

SPINAL STENOSIS. Narrowing of the canals in the vertebrae or around the nerve roots, causing pressure on the spinal cord and nerves.

SPINE. A term for the backbone that includes the vertebrae, disks, and spinal cord as a whole.

SPIRAL CT. Also referred to as helical CT, this method allows for continuous 360-degree x-ray image capture.

SPIROCHETE. A long, slender, coiled-shape bacterium, such as *T. pallidum* that causes syphilis.

SPIROMETER. A device used to measure the volume and rate at which air is inhaled and exhaled by the patient's lungs.

SPIROMETRY. A test using an instrument called a spirometer that shows how difficult it is for an asthmatic individual to breathe. It is used to determine the severity of asthma and to see how well it is responding to treatment.

SPLEEN. An organ located at the left side of the stomach that acts as a reservoir for blood cells and produces lymphocytes and other products involved in fighting infection.

SPLENECTOMY. Surgical removal of the spleen.

SPLENOMEGALY. Abnormal enlargement of the spleen.

SPLINT. A thin piece of rigid material that is sometimes used during nasal surgery to hold certain structures in place until healing is underway.

SPONDYLITIS. An inflammation of the spine.

SPONDYLOSIS. Arthritis of the spine.

SPONTANEOUS PNEUMOTHORAX. Air in the chest cavity that occurs because of disease or other naturally occurring cause. Air and blood together in this space is called a pneumohemothorax.

SPORADIC. Occurring at random or by chance, and not as a result of a genetically determined, or inherited, trait.

SPORE. A dormant form assumed by some bacteria, such as anthrax, that enable the bacterium to survive high temperatures, dryness, and lack of nourishment for long periods of time. Under proper conditions, the spore may revert to the actively multiplying form of the bacteria.

(c) 2011 Cengage Learning. All Rights Reserved.

SPRUE. A disorder of impaired absorption of nutrients from the diet by the small intestine (malabsorption), resulting in malnutrition. Two forms of sprue exist: tropical sprue, which occurs mainly in tropical regions; and celiac sprue, which occurs more widely and is due to sensitivity to the wheat protein gluten.

SPUR. Any projection from a bone.

SPUTUM. The mixture of mucus, irritants, and other substances expelled from the lungs by coughing.

SPUTUM CULTURE. A laboratory analysis of the fluid produced from the lungs during coughing. A sputum culture can confirm the presence of pathogens in the respiratory system, and help to diagnose certain respiratory infections, including bronchitis, tuberculosis, and pneumonia.

SPUTUM CYTOLOGY. A lab test in which a microscope is used to check for cancer cells in the sputum.

SQUAMOUS CELL CARCINOMA. A form of skin cancer that usually originates in sun-damaged areas or pre-existing lesions; at first local and superficial, it may later spread to other areas of the body.

SQUAMOUS CELLS. Thin, flat cells of the surfaces of the skin and cervix and linings of various organs.

SQUAMOUS EPITHELIAL CELLS. Thin, flat cells found in layers or sheets covering surfaces such as skin and the linings of blood vessels and esophagus.

SQUAMOUS INTRAEPITHELIAL LESION (SIL). A term used to categorize the severity of abnormal changes arising in the squamous, or outermost, layer of the cervix.

STAGING. The classification of cancerous tumors according to the extent and spread of the tumor.

STAMINA. Staying power, endurance.

STANDARD DEVIATION. A measure of the distribution of scores around the average (mean). In a normal distribution, two standard deviations above and below the mean includes about 95% of all samples.

STANDARDIZATION. The process of determining established norms and procedures for a test to act as a standard reference point for future test results.

STAPHYLOCOCCAL INFECTION. An infection caused by any of several pathogenic species of *Staphylococcus*, commonly characterized by the formation of abscesses of the skin or other organs.

STAPHYLOCOCCAL SCALDED SKIN SYNDROME. A disease caused by *Staphylococcus aureus,* in which large sheets of skin may peel away from the body. It most often affects infants, young children, and people with weakened immune systems.

STAPHYLOCOCCUS. A genus of bacteria that is commonly found on human skin and mucous membranes.

STATIC ENCEPHALOPATHY. A disease of the brain that does not get better or worse.

STATINS. A group of medications given to lower blood cholesterol levels that work by inhibiting an enzyme involved in cholesterol formation. Statins are also known as HMG-CoA reductase inhibitors.

STATUS MIGRAINOSUS. The medical term for an acute migraine headache that lasts 72 hours or longer.

STEAM DISTILLATION. A process of extracting essential oils from plant products through a heating and evaporation process.

STEATORRHEA. An excessive amount of fat in the stool.

STEM CELL. Undifferentiated cell that retains the ability to develop into any one of numerous cell types.

STENOSIS (PLURAL, STENOSES). The narrowing or constriction of an opening or passageway in the body.

STENT. A device made of expandable, metal mesh that is placed (by using a balloon catheter) at the site of a narrowing artery; the stent stays in place to keep the artery open.

STEREOPSIS. The visual perception of depth, or the ability to see three-dimensionally. For this to occur, the person must be binocular.

STEREOTACTIC. Characterized by precise positioning in space. When applied to radiosurgery, stereotactic refers to a system of three-dimensional coordinates for locating the target site.

STEREOTACTIC BIOPSY. A biopsy taken by precisely locating areas of abnormal growth through the use of delicate instruments.

STEREOTACTIC BRAIN NEEDLE BIOPSY. In this procedure a computer uses information from a CT or MRI to create a three-dimensional map of the operation site to better guide the needle to perform the biopsy.

STEREOTACTIC TECHNIQUE. A technique used by neurosurgeons to pinpoint locations within the brain. It employs computer imaging to create an external frame of reference.

STERILE. Free of microorganisms.

STERILITY. Inability to conceive a child.

(c) 2011 Cengage Learning. All Rights Reserved.

STERNUM. The breastbone. The sternum is located over the heart, is the point of attachment for ribs at the front of the body, and provides protection to the heart beneath it.

STEROIDS. A class of hormones and drugs that includes sex and stress hormones and anti-inflammatory medications, contraceptives, and growth-promoting substances.

STEROLS. Steroid alcohols, such as cholesterol, that are widely distributed in the body.

STETHOSCOPE. A medical instrument for listening to a patient's heart and lungs.

STEVENS-JOHNSON SYNDROME. A severe inflammatory skin eruption that occurs as a result of an allergic reaction or respiratory infection.

STIMULANTS. A class of psychoactive drugs that improve alertness and concentration. They may be used to treat attention disorders but have a high potential for abuse.

STIMULUS. A factor capable of eliciting a response in a nerve.

STOCKINETTE. A soft elastic material used for bandages and clothing for infants.

STOMA. A surgical opening made in the abdominal wall to allow waste products to pass directly to the outside.

STOMATITIS. Inflammation of the lining of the mouth, gums, or tongue.

STONES. Also known as calculi, stones result from an excessive build-up of mineral crystals in the kidney. Symptoms of stones include intense pain in the lower back or abdomen, urinary tract infection, fever, burning sensation on urination, and/or blood in the urine.

STOOL. The solid waste that is left after food is digested. Stool forms in the intestines and passes out of the body through the anus.

STRABISMUS. A disorder where the two eyes do not point in the same direction.

STRANGULATED HERNIA. A hernia that is so tightly incarcerated outside the abdominal wall that the intestine is blocked and the blood supply to that part of the intestine is cut off.

STRANGULATED OBSTRUCTION. An obstruction in which a loop of the intestine has its blood supply cut off.

STRANGULATION. A condition in which a vessel, section of the intestine, or other body part is compressed or constricted to the point that blood cannot circulate.

STRAWBERRY TONGUE. A sign of scarlet fever in which the tongue appears to have a red coating with large raised bumps.

STREET DRUG. A substance purchased from a drug dealer; may be a legal substance, sold without a prescription and not for medical use, or it may be a substance that is illegal to possess.

STREP THROAT. An infection of the throat caused by bacteria of the *Streptococcus* family, which causes tonsillitis.

STREPTOCOCCAL INFECTION. An infection caused by a pathogenic bacteria of one of several species of the genus *Streptococcus* or their toxins. Almost any organ in the body may be involved.

STREPTOCOCCUS (PLURAL, STREPTOCOCCI). A genus of spherical-shaped anaerobic bacteria occurring in pairs or chains.

STRESS FRACTURE. A crack in a bone (usually the result of overuse).

STRESS INCONTINENCE. Leakage of urine upon movements that put pressure on the abdominal muscles such as coughing, sneezing, laughing, or exercise. One of four types of incontinence.

STRESS MANAGEMENT. A set of techniques and programs intended to help people deal more effectively with stress in their lives by analyzing the specific stressors and taking positive actions to minimize their effects.

STRESS TEST. A test that involves an electrocardiogram during rest and exercise to determine how the heart responds to stress.

STRESSOR. A stimulus or event that provokes a stress response in an organism. Stressors can be categorized as acute or chronic, and as external or internal to the organism.

STRIATED MUSCLE. Also known as striped muscle; it includes muscles of the skeletal system and of the heart.

STRICTURE. An abnormal narrowing of a tube or passageway.

STRIDOR. A harsh or crowing breath sound caused by partial blockage of the patient's upper airway.

(c) 2011 Cengage Learning. All Rights Reserved.

STRING TEST. A test performed to diagnose threadworm infection. The patient is asked to swallow a weighted string that absorbs stomach juices, which can be analyzed for the presence of threadworm larvae.

STROKE. Irreversible damage to the brain caused by insufficient blood flow to the brain as the result of a blocked artery. Damage can include loss of speech or vision, paralysis, cognitive impairment, and death.

STROMA. A term used to describe the supportive tissue surrounding a particular structure, such as an organ.

STRUCTURAL INTEGRATION. The term used to describe the method and philosophy of life associated with Rolfing. Its fundamental concept is the vertical line.

STUNTING. A height more than two standard deviations from the median height for the age in the reference population.

STYPTIC. Any remedy with an astringent and hemostatic (stopping bleeding) quality.

SUBACUTE. An abnormal condition present in a person who appears to be clinically well.

SUBARACHNOID. Referring to the space underneath the arachnoid mater.

SUBARACHNOID HEMORRHAGE. A cause of some strokes in which arteries on the surface of the brain begin bleeding.

SUBARACHNOID SPACE. A space between membranes that covers and protects the brain.

SUBCLAVIAN. Located beneath the collarbone (clavicle).

SUBCORTICAL APHASIA. A condition characterized by either partial or total loss of the ability to communicate verbally or using written words as a result of damage to non language-dominated areas of the brain. This condition may be caused by a stroke, head injury, brain tumor, or infection.

SUBCUTANEOUS. Referring to the area beneath the skin.

SUBCUTANEOUS EMPHYSEMA. A pathologic accumulation of air underneath the skin resulting from improper insufflation technique.

SUBDURAL HEMATOMA. A collection of blood or a clot trapped under the dura mater, the outermost membrane surrounding the brain and spinal cord, often causing neurological damage due to pressure on the brain.

SUBLUXATION. Misalignment between vertebrae that structurally and functionally impairs nerve function.

SUBSTANTIA NIGRA. One of the movement control centers of the brain.

SUBTHRESHOLD. A term used in psychiatry to describe a condition that has significant clinical features but does not meet the full criteria of major disorders. Adjustment disorders are considered subthreshold disorders.

SUCCIMER (CHEMET). A drug used to remove excess lead from the body.

SUCCUSSION. The act of shaking diluted homeopathic remedies as part of the process of potentization.

SUCROSE. The scientific name for table sugar. Sucrose is a disaccharide derived from glucose and fructose.

SUGARS. Those carbohydrates having the general composition of one part carbon, two parts hydrogen, and one part oxygen.

SUICIDE GESTURE. Attempted suicide characterized by a low-lethality method, low level of intent or planning, and little physical damage; sometimes called pseudocide.

SUICIDE MAGNET. A bridge, tall building, or geographic location that acquires a reputation for attracting people who want to commit suicide and attempt it.

SULFADOXONE/PYRIMETHAMINE (FANSIDAR). An antimalarial drug developed in the 1960s. It is the first drug tried in some parts of the world where chloroquine resistance is widespread. It has been associated with severe allergic reactions due to its sulfa component.

SULFINPYRAZONE. A drug that corrects hyperuricemia by increasing the urinary excretion of urate.

SULFITE. A type of preservative that causes allergic reactions in some people.

SULFONAMIDE DRUGS. A group of antibacterial drugs used to treat infections of the lungs and skin, among other things.

SUNBLOCK. A skin preparation containing an active ingredient, such as titanium oxide, that prevents sunburn by physically blocking out ultraviolet radiation.

(c) 2011 Cengage Learning. All Rights Reserved.

SUNSCREEN. Products that block the damaging rays of the sun. Good sunscreens contain either para-aminobenzoic acid (PABA) or benzophenone, or both. Sunscreen protection factors range from 2–45.

SUNSETTING. Confusion or agitation in the evening.

SUPERINFECTION. Infection by a second virus after a previous infection by a different virus has become well established.

SUPERIOR MESENTERIC ARTERY SYNDROME. A condition in which a person vomits after meals due to blockage of the blood supply to the intestine.

SUPERIOR VENA CAVA. The major vein that carries blood from the upper body to the heart.

SUPERIOR VENA CAVA (SVC) SYNDROME. A condition seen in lung cancer patients where the tumor presses against a large blood vessel and causes various symptoms.

SUPPORT GROUP. A group whose primary purpose is the provision of empathy and emotional support for its members. Support groups are less formal and less goal-directed than group therapy.

SUPPORTIVE THERAPY. An approach to psychotherapy that seeks to encourage the patient or offer emotional support to him or her, as distinct from insight-oriented or educational approaches to treatment.

SUPPOSITORY. A solid medication that slowly dissolves after being inserted into the rectum or other body cavity.

SUPPURATE. To produce or discharge pus.

SUPRAGLOTTITIS. Another term for epiglottitis.

SUPRASPINATUS. A muscle at the top of the shoulder blade.

SUPRAVENTRICULAR. A term for an event that occurs in the upper chambers (atria) of the heart.

SUPRAVENTRICULAR TACHYCARDIA. A fast heart beat that originates above the ventricles.

SURFACE TENSION. The attraction of molecules in a fluid for each other.

SURFACTANT. A substance secreted by the alveoli in the lungs that reduces the surface tension of lung fluids, allowing gas exchange and helping maintain the elasticity of lung tissue.

SWEAT GLANDS. Tiny glands scattered throughout the skin that produce sweat.

SWIMMER'S ITCH. An allergic skin inflammation caused by a sensitivity to flatworms that die under the skin, causing an itchy rash.

SYDENHAM'S CHOREA. A childhood disorder of the central nervous system. Once called St. Vitus' dance, the condition is characterized by involuntary, jerky movements that usually follow an attack of rheumatic fever. Rare in the United States today, but a common disorder in developing countries. Usually resolves in two to three months with no long-term adverse effects.

SYLVATIC. Pertaining to or living in the woods or forested areas. The form of yellow fever transmitted by mosquitoes to rainforest monkeys is called sylvatic yellow fever.

SYMPATHETIC NERVE. A nerve of the autonomic nervous system that regulates involuntary and automatic reactions, especially to stress.

SYMPATHETIC NERVOUS SYSTEM. A division of the autonomic nervous sytem, the portion of the nervous system that controls involuntary bodily functions such as heart rate.

SYMPATHOMIMETIC. Denoting a drug that mimics the effects of stimulation of organs and structures by the sympathetic nervous system. The sympathetic nervous system pertains to the part of the nervous system originating in the thoracic and lumbar regions of the spinal cord.

SYMPTOMATIC. Refers to treatment that addresses the symptoms of an illness, but not its underlying cause.

SYNAPSE. A connection between nerve cells, by which nervous excitation is transferred from one cell to the other.

SYNCOPE. A loss of consciousness over a short period of time, caused by a temporary lack of oxygen in the brain.

SYNDACTYLY. A fusion of two or more toes or fingers.

SYNDROME. A collection of abnormalities that occur often enough to suggest they have a common cause.

SYNDROME OF INAPPROPRIATE SECRETION OF ANTIDIURETIC HORMONE (SIADH). A potentially fatal condition of excessive secretion of ADH, leading to concentrated urine and blood sodium deficiency.

SYNDROME X. A term that was sometimes used for metabolic syndrome when the syndrome was first identified in the 1960s.

(c) 2011 Cengage Learning. All Rights Reserved.

SYNERGISTIC. The combined action of two or more processes is greater than the sum of each acting separately.

SYNGENEIC. Referring to a bone marrow transplant from one identical twin to the other.

SYNOVIAL FLUID (SF). A fluid secreted by tissues surrounding the joints that lubricates the joints.

SYNOVIAL JOINT. A joint that allows for bone movement.

SYNOVIAL MEMBRANE. A layer of connective tissue that lines the cavities of joints.

SYNOVIAL TENDON SHEATH. Where the tendons cross joints, they are sheathed in thin membranes known as synovium, which provide lubrication to decrease friction.

SYNOVITIS. Inflammation of the synovium, a membrane found inside joints.

SYNOVIUM. A fibrous envelope that produces a fluid to help to reduce friction and wear in a joint.

SYPHILIS. A sexually transmitted disease caused by a bacteria. There is also a second form that is not sexually transmitted but passed on by direct contact with the patient or through use of shared food dishes and utensils.

SYSTEMIC. A term used to describe a medicine that has effects throughout the body as opposed to topical drugs that work on the skin. Most medicines that are taken by mouth or by injection are systemic drugs.

SYSTEMIC CIRCULATION. Through the body, as opposed to pulmonary circulation (through the lungs).

SYSTEMIC DISEASE. A disease that affects the entire body instead of a specific organ.

SYSTEMIC LUPUS ERYTHEMATOSUS (SLE). A chronic, inflammatory, autoimmune disorder in which the individual's immune system attacks, injures, and destroys the body's own organs and tissues. It may affect many organ systems including the skin, joints, lungs, heart, and kidneys.

SYSTEMIC SCLEROSIS. A rare disorder that causes thickening and scarring of multiple organ systems.

SYSTOLE. The phase of blood circulation in which the heart's pumping chambers (ventricles) are actively pumping blood. The ventricles are squeezing (contracting) forcefully, and the pressure against the walls of the arteries is at its highest.

SYSTOLIC. Relating to or occuring during systole (e.g., systolic blood pressure).

T

T CELLS (T LYMPHOCYTES). White blood cells that originate in the thymus gland. T cells regulate the immune system's response to infections, including HIV. CD4 lymphocytes are a subset of T lymphocytes.

TABES DORSALIS. A progressive deterioration of the spinal cord and spinal nerves that is associated with tertiary syphilis.

TABLEWORK. The passive phase of Trager therapy, in which the practitioner uses gentle and noninvasive movements to allow the client to relax deeply and experience physical movement as free and effortless.

TAC. A topical anesthetic mixture containing tetracaine, epinephrine (adrenaline), and cocaine.

TACHYCARDIA. Rapid heart rate, defined as more than 100 beats per minute.

TAENIASIS. Parasitic infection caused by the presence of tapeworms from the *Taenia* genus, such as the pork tapeworm (*Taenia solium*) or the beef tapeworm (*Taenia saginata*).

TALK THERAPY. A general term for any form of psychotherapy based on conversational interaction between a trained therapist and a client. It includes psychodynamic therapy, humanistic therapy, and the various behavioral therapies as well as psychoanalysis.

TAMPONADE. To occlude by pressure.

TANNER STAGES. A set of scales to measure sexual development during puberty, named for James Tanner (1920–2010), the British pediatrician who devised it.

TAPERING. Gradually reducing the intake of an addictive substance (such as nicotine) as part of a cessation effort.

TAPEWORM. An intestinal parasite that attaches to the intestine or travels to other organs such as the liver and lungs.

TARDIVE DYSKINESIA. Involuntary movements of the face and/or body which are a side effect of the long-term use of some older antipsychotic (neuroleptic) drugs. Tardive dyskinesia affects 15-20% of patients on long-term neuroleptic treatment.

(c) 2011 Cengage Learning. All Rights Reserved.

TARGET HEART RATE. The heart rate, in beats per minute (bpm), that should be maintained during cardiovascular exercise by an individual of a given age.

TARTAR. A hardened yellow or brown mineral deposit from unremoved plaque; also called calculus.

TASER. Also called a conducted electrical weapon or CEW, a taser is an electroshock device used by some police departments in various countries to subdue armed or otherwise dangerous suspects without having to use lethal force. Tasers work by interfering with the brain's capacity to control voluntary muscles. The name *taser* is an acronym for *Thomas A. Swift's Electric Rifle*, an adventure novel about a fictional weapon published in 1911.

TAU PROTEIN. A protein involved in maintaining the internal structure of nerve cells. Tau protein is damaged in AD and forms neurofibrillary tangles.

TAURINE. An amino acid that is important in the development of brain tissue. Taurine is a key component of bile which is needed to digest fats.

TAY-SACHS DISEASE. An inherited disease prevalent among the Ashkenazi Jewish population of the United States. Infants with the disease are unable to process a certain type of fat that accumulates in nerve and brain cells, causing mental and physical retardation, and death by age four.

TD. Tetanus and diphtheria vaccine.

TEAR. A drop of the clear, salty fluid secreted by the lachrimal gland.

TECHNETIUM. A radioactive isotope frequently used in radionuclide scanning of the heart and other organs. It is produced during nuclear fission reactions.

TELANGIECTASIAS. Very small arteriovenous malformations, or connections between the arteries and veins. The result is small red spots on the skin known as "spider veins."

TELEMEDICINE. The use of communications or information technology to deliver clinical care or diagnosis. The medical information may be conveyed by telephone, Internet connections, or other electronic networks.

TEMPEH. A fermented cake of soybeans and other grains; it is a staple food in Indonesia.

TEMPERAMENT. A person's natural or genetically determined disposition.

TEMPORAL ARTERITIS. Also known as giant cell arteritis. Inflammation of the large arteries located in the temples which is marked by the presence of giant cells and symptoms of headache and facial pain.

TEMPORAL BONES. The compound bones that form the left and right sides of the skull.

TEMPORAL LOBE. The part of each side or hemisphere of the brain that is on the side of the head, nearest the ears.

TEMPOROMANDIBULAR JOINT (TMJ). One of a pair of joints that attaches the mandible of the jaw to the temporal bone of the skull. It is a combination of a hinge and a gliding joint.

TEMPOROMANDIBULAR JOINT SYNDROME (TMJ SYNDROME). An incorrect alignment of the lower jaw to the skull that causes the bite to be off line. It causes pain, chronic headaches, nausea, and other symptoms.

TENDINITIS. Inflammation of a tendon, which is a tough band of tissue that connects muscle to bone.

TENDON. A strong connective tissue that connects muscle to bone.

TENDON REFLEX. A reflex action, such as a knee jerk, in which a light blow to the tendon causes the muscle to contract.

TENDON SHEATH. A membrane covering a tendon.

TENESMUS. Straining to urinate or defecate without being able to do so. Tenesmus is a characteristic feature of bacillary dysentery.

TENOSYNOVITIS. Inflammation of a tendon and its enveloping sheath, usually resulting from overuse injury.

TENOTOMY. A surgical procedure that cuts the tendon of a contracted muscle to allow lengthening.

TENS. The abbreviation for transcutaneous electrical nerve stimulation, a technique used to control chronic pain. Electrodes placed over the painful area deliver a mild electrical impulse to nearby nerve pathways.

TENSILON TEST. A test for diagnosing myasthenia gravis. Tensilon is injected into a vein and, if the person has MG, their muscle strength will improve for about five minutes.

TENSION-TYPE HEADACHE. A dull pain that seems to exert pressure on the head; the most common form of headache.

TERATOGEN. Any drug, chemical, maternal disease, or exposure that can cause physical or functional defects in an exposed embryo or fetus.

(c) 2011 Cengage Learning. All Rights Reserved.

TESTES. The pair of male reproductive glands enclosed in the scrotum that produce the male sex hormone testosterone and the spermatozoa. The singular form is testis.

TESTICULAR CANCER. A cancer that originates in the testes.

TESTOSTERONE. Male hormone produced by the testes and (in small amounts) in the ovaries. Testosterone is responsible for some masculine secondary sex characteristics such as growth of body hair and deepening voice.

TETANUS. An acute infectious disease caused by a toxin produced by the bacterium *Clostridium tetani* and usually introduced into the body through a wound.

TETANUS TOXOID. Tetanus toxoid is a vaccine used to prevent tetanus (also known as lockjaw).

TETANY. A disorder of the nervous system characterized by muscle cramps, spasms of the arms and legs, and numbness of the extremities.

TETRALOGY OF FALLOT. A cyanotic defect in which the blood pumped through the body has too little oxygen. Tetralogy of Fallot includes four defects: a large hole between the ventricles, narrowing at or beneath the pulmonary valve, an overly muscular right ventricle, and an aorta over the large hole.

THALAMOTOMY. A surgical procedure that destroys part of a large oval area of gray matter within the brain that acts as a relay center for nerve impulses. The thalamus is an essential part of the nerve pathway that controls intentional movement. By destroying tissue at a particular spot on the thalamus, the surgeon can interrupt the nerve signals that cause tremor.

THALAMUS. A large oval area of gray matter within the brain that relays nerve impulses from the basal ganglia to the cerebellum, both parts of the brain that control and regulate muscle movement.

THALASSEMIA. A group of inherited disorders that affects hemoglobin production. Because hemoglobin production is impaired, a person with this disorder may suffer mild to severe anemia. Certain types of thalassemia can be fatal.

THANATOLOGY. The medical, psychological, or legal study of death and dying.

THELARCHE. The onset of breast development in girls. It is usually first noticed as a firm but tender lump directly under the center of the nipple.

THERAPEUTIC. Curative or healing.

THIAMINE. A B vitamin essential for the body to process carbohydrates and fats.

THIAMINE PYROPHOSPHATE (TPP). The coenzyme containing thiamine that is essential in converting glucose to energy.

THIAZIDE DIURETIC. A particular class of medication that encourages urine production.

THIAZIDES. A group of drugs used to increase urine output.

THIMEROSAL. A crystalline organic mercury compound used as an antifungal and antibacterial agent and present in very small amounts in some vaccines.

THORACENTESIS. A procedure in which fluid is withdrawn from the pleural cavity through a needle inserted between the ribs. The fluid may be withdrawn either for diagnostic tests or to drain the cavity.

THORACIC. Pertaining to the area bounded by the rib cage.

THORACIC AORTIC ANEURYSM. Occurs when an area in the thoracic section of the aorta (the chest) is weakened and bulges like a balloon. The thoracic section supplies blood to the upper body.

THORACIC VERTEBRAE. The vertebrae in the chest region to which the ribs attach.

THORACOSCOPY. Examination of the contents of the chest through a thin, lighted tube passed through a small incision.

THORACOTOMY. Open chest surgery.

THORAX. The chest area, which runs between the abdomen and neck and is encased in the ribs.

THREADWORM. Any long, thin nematode worm.

THROAT CULTURE. A test for strep throat that involves swabbing the back of the throat and sending the swab to a laboratory, which will determine whether bacteria is present.

THROMBIN. An enzyme in blood plasma that helps to convert fibrinogen to fibrin during the last stage of the clotting process.

THROMBIN INHIBITOR. Thrombin inhibitors are one type of anticoagulant medication, used to help prevent formation of harmful blood clots in the body by blocking the activity of thrombin.

THROMBOCYTE. Another name for platelet.

THROMBOCYTOPENIA. An abnormal decline in the number of platelets in the blood.

(c) 2011 Cengage Learning. All Rights Reserved.

THROMBOCYTOSIS. A vascular condition characterized by high blood platelet counts.

THROMBOEMBOLISM. A clot in the blood that forms and blocks a blood vessel. It can lead to infarction, or death of the surrounding tissue due to lack of blood supply.

THROMBOLYSIS. A treatment that opens up blood flow and may prevent permanent damage to the blood vessels.

THROMBOLYTICS. Drugs that dissolve blood clots. Thrombolytics are used to treat embolisms.

THROMBOPHLEBITIS. Inflammation of a vein, associated with the formation of a blood clot.

THROMBOPLASTIN. A protein in blood that converts prothrombin to thrombin.

THROMBOSIS. Formation of a clot in the blood that either blocks, or partially blocks a blood vessel. The thrombus may lead to infarction, or death of tissue, due to a blocked blood supply.

THROMBOTIC. Relating to, caused by, or characterized by thrombosis.

THROMBUS. A blood clot that may form in a blood vessel or in one of the cavities of the heart.

THRUSH. A disease of the mouth, caused by *Candida albicans* and characterized by a whitish growth and ulcers. It can be diagnosed with the KOH test.

THYMOMA. A tumor that originates in the thymus, a small gland just in front of the heart that produces hormones necessary for the development of certain components of the immune system.

THYMUS. A gland located behind the sternum that coordinates the development of the immune system.

THYROID. A butterfly-shaped gland in front and to the sides of the upper part of the windpipe; influences body processes like growth, development, reproduction, and metabolism.

THYROID STORM. A rare but potentially life-threatening complication of hyperthyroidism, characterized by fever over 104°F, irregular heart rhythm, vomiting, diarrhea, dehydration, coma, and death.

THYROIDECTOMY. Surgical removal of the thyroid gland.

THYROIDITIS. Inflammation of the thyroid gland. It can be caused by a viral infection, a malfunction of the immune system, or certain medications.

THYROID-STIMULATING HORMONE (TSH). A hormone produced by the pituitary gland that stimulates the thyroid gland to produce the hormones that regulate metabolism. Also called thyrotropin.

THYROTOXICOSIS. An excess of thyroid hormones in the blood, causing a variety of symptoms that include rapid heart beat, sweating, anxiety, and tremor.

THYROXINE (T_4). The thyroid hormone that regulates many essential body processes.

TIBIA. One of the two bones of the lower leg.

TIC. Brief and intermittent involuntary movement or sound.

TICK-BORNE DISEASE. A disease that is spread to animals by the bite of an infected tick.

TILT TABLE; TILTBOARD. An apparatus for rotating a person from horizontal to an oblique or vertical position.

TINEA. A superficial infection of the skin, hair, or nails, caused by a fungus and commonly known as ringworm.

TINNITUS. A sensation of noise or ringing in the ears. Tinnitus may be a symptom of cerumen impaction.

TISSUE FACTOR. A glycoprotein involved in blood coagulation.

TISSUE PLASMINOGEN ACTIVATOR (TPA). A substance that is sometimes given to patients within three hours of a stroke to dissolve blood clots within the brain.

TITER. The concentration of a substance in a given sample of blood or other tissue fluid.

TITRATE. To analyze the best end point (for dose) for a medication.

TNM SYSTEM. A commonly used staging system that examines the main tumor (T), the lymph nodes (N), and metastases (M).

TOCOLYTIC. A medication that inhibits uterine contractions.

TOFU. A soft cheeselike food made from curdled soybean milk.

TOLERANCE. The requirement for higher doses of a substance or more frequent engagement in an activity to achieve the same effect.

(c) 2011 Cengage Learning. All Rights Reserved.

TOMOGRAPHY. A technique of using ultrasound, gamma rays, or x rays to produce a focused image of the structures across a specific depth within the body, while blurring details at other depths.

TONIFICATION. Acupuncture technique for strengthening the body.

TONOMETER. An instrument that measures intraocular pressure (IOP).

TONOMETRY. The measurement of pressure.

TONSILLECTOMY. Surgical removal of the tonsils.

TONSILLITIS. Inflammation of the tonsils, which are in the back of the throat.

TONSILS. Oval masses of lymphoid tissue on each side of the throat.

TOPHUS (PLURAL, TOPHI). A chalky deposit of a uric acid compound found in gout. Tophi occur most frequently around joints and in the external ear.

TOPICAL. Referring to a medication or other preparation applied to the skin or the outside of the body.

TOPICAL CORTICOSTEROIDS. Cortisone and related drugs used on the skin and in the eye, usually for allergic conditions.

TORSION. The action of twisting.

TORTUOUS ARTERIES. Arteries with many bends and twists.

TOTAL GASTRECTOMY. Surgical removal (excision) of the entire stomach.

TOTAL LUNG CAPACITY. The volume of air in the lungs at the end of a deep breath. The normal value in adults is between 4 and 6 quarts.

TOTAL PARENTERAL NUTRITION (TPN). Intravenous administration of a solution containing all of the nutrients required by the body, such as protein, fat, calories, vitamins, and minerals. TPN provides a complete and balanced source of nutrients for patients who cannot consume a normal diet.

TOTAL-SKIN ELECTRON BEAM THERAPY. A method of radiation therapy used to treat CTCL that involves bombarding the entire body surface with high-energy electrons.

TOURETTE SYNDROME. An abnormal condition that causes uncontrollable facial grimaces and tics as well as arm and shoulder movements. Tourette syndrome is perhaps best known for uncontrollable vocal tics that include grunts, shouts, and use of obscene language (coprolalia).

TOURNIQUET. Any device that is used to compress a blood vessel to stop bleeding or to collect a blood sample. Phlebotomists usually use an elastic band as a tourniquet.

TOXEMIA. Poisoning of the blood.

TOXIC. Poisonous.

TOXIC MEGACOLON. Acute enlargement or dilation of the large intestine.

TOXIC OXYGEN. Oxygen is required for life, as it is needed for energy production. When oxygen is used by the body, most of it is converted to water. However, a small fraction of the oxygen breathed is converted to toxic oxygen. The body uses several different processes for preventing and repairing toxic-oxygen damage. One of these processes involves vitamin E.

TOXIC SHOCK SYNDROME. An uncommon, but potentially fatal, disease that has been associated with the use of diaphragms and vaginal tampons. The symptoms include high fever, vomiting, and diarrhea.

TOXIC THYROID ADENOMA. Self-contained concentrations of thyroid tissue that may produce excessive amounts of thyroid hormone.

TOXICOLOGY. The branch of medicine that deals with the effects, detection, and treatment of poisons.

TOXIN. A substance that has poisonous effects on the body.

TOXOID. A preparation made from inactivated exotoxin, used in immunization.

TRABECULAR MESHWORK. A sponge-like tissue located near the cornea and iris that functions to drain the aqueous humor from the eye into the blood.

TRABECULOPLASTY. Laser surgery that creates perforations in the trabeculum, to drain built up aqueous humor and relieve pressure.

TRABECULUM. Tissue that is a drainage point for aqueous humor in the eye.

TRACE ELEMENTS. A group of elements that are present in the human body in very small amounts but are nonetheless important to good health. They include chromium, copper, cobalt, iodine, iron, selenium, and zinc. Trace elements are also called micronutrients.

TRACER. A substance containing a radioisotope, injected into the body and followed in order to obtain information about various metabolic processes in the body.

(c) 2011 Cengage Learning. All Rights Reserved.

TRACHEA. The tube that leads from the larynx or voice box to two major air passages that bring oxygen to each lung. The trachea is sometimes called the windpipe.

TRACHEOBRONCHIAL. Pertaining both to the tracheal and bronchial tubes or to their junction.

TRACHEOSTOMY. A procedure in which a small opening is made in the neck and into the trachea. A breathing tube is then placed through this opening.

TRACHEOSTOMY TUBE. A tube that is inserted into an incision in the trachea (tracheostomy) to relieve upper airway obstruction.

TRACHEOTOMY. The surgical creation of an opening in the trachea that functions as an alternative airway so that the patient may breathe.

TRACTION. The process of placing a bone, limb, or group of muscles under tension by applying weights and pulleys. The goal is to realign or immobilize the part or to relieve pressure on that particular area to promote healing and restore function.

TRANQUILIZER (MINOR). A drug that has a calming effect and is used to treat anxiety and emotional tension.

TRANS FAT. Fat that is produced by hydrogenation during food processing; trans fats increase bad cholesterol and decrease good cholesterol.

TRANSABDOMINAL ULTRASOUND. A small handheld instrument called a transducer is passed back and forth over the pelvic area to provide images of the abdomen.

TRANSCENDENTAL MEDITATION (TM). A meditation technique based on Hindu practices that involves the repetition of a mantra.

TRANSCORTICAL APHASIA. A condition characterized by either partial or total loss of the ability to communicate verbally or using written words that does not affect an individual's ability to repeat words, phrases, and sentences.

TRANSCRANIAL MAGNETIC STIMULATION. A procedure used to treat patients with depression.

TRANSCUTANEOUS ELECTRICAL NERVE STIMULATION (TENS). A treatment in which a mild electrical current is passed through electrodes on the skin to stimulate nerves and block pain signals.

TRANSDUCER. A device that converts electrical signals into ultrasound waves and ultrasound waves back into electrical impulses.

TRANSESOPHAGEAL ECHOCARDIOGRAPHY. A diagnostic test using an ultrasound device, passed into the esophagus of the patient, to create a clear image of the heart muscle.

TRANSFERENCE. The redirection of feelings and thoughts from early childhood experiences toward a person in the present, usually the analyst.

TRANSFERRIN. A protein in blood plasma that carries iron derived from food intake to the liver, spleen, and bone marrow.

TRANSFUSION. The therapeutic introduction of blood or a blood component into a patient's bloodstream.

TRANSGENIC ANIMAL. Animals that have had genes from other species inserted into their genetic code.

TRANSIENT ISCHEMIC ATTACK (TIA). A brief stroke lasting from a few minutes to 24 hours. TIAs are sometimes called mini-strokes.

TRANSILLUMINATION. A technique by which a strong light is shone through body tissues to examine an organ or structure.

TRANSLOCATION. The transfer of one part of a chromosome to another chromosome during cell division.

TRANSPLANTATION. The removal of tissue from one part of the body for implantation to another part of the body; or the removal of tissue or an organ from one individual and its implantation in another individual by surgery.

TRANSPOSITION OF THE GREAT ARTERIES. A cyanotic defect in which the blood pumped through the body has too little oxygen. The pulmonary artery and the aorta are reversed.

TRANSSEXUAL. A person with gender identity disorder who has an overwhelming desire to change anatomic sex; one who seeks hormonal or surgical treatment to change sex.

TRANSTRACHEAL BIOPSY. A transtracheal biopsy is the removal of a small piece of tissue from across the trachea or windpipe for examination under a microscope.

TRANSUDATE. The type of pleural effusion seen with heart failure or other disorders of the circulation. It features clear fluid containing few cells and little protein.

TRANSUDATION. The passage of fluid, as through blood vessels into the vagina.

TRANSURETHRAL RESECTION OF THE PROSTATE (TURP). Surgical removal of a portion of the prostate through the urethra, a method of treating the symptoms of an enlarged prostate, whether from BPH or cancer.

(c) 2011 Cengage Learning. All Rights Reserved.

TRANSVERSE PRESENTATION. A position in which the fetus lies sideways against the birth canal, with a shoulder or arm possibly entering the canal.

TRANSVESTITISM. Sexual arousal from dressing in the clothes of the opposite sex.

TRAUMA. A disastrous or life-threatening event that can cause severe emotional distress, including dissociative symptoms and disorders.

TRAUMATIC GRIEF. Grief resulting from the loss of a loved one in a traumatic situation (natural or transportation disaster, act of terrorism or mass murder, etc.).

TRAUMATIC SHOCK. A condition of depressed body functions as a reaction to injury with loss of body fluids or lack of oxygen. Signs of traumatic shock include weak and rapid pulse, shallow and rapid breathing, and pale, cool, clammy skin.

TRAVELER'S DIARRHEA. An illness due to infection from a bacteria or parasite that occurs in persons traveling to areas where there is a high frequency of the illness. The disease is usually spread by contaminated food or water.

TREMATODE. Parasitic flatworms or another name for fluke, taken from a Greek word that means having holes.

TREMOR. Shakiness or trembling.

TREMOR CONTROL THERAPY. A method for controlling tremor by self-administered shocks to the part of the brain that controls intentional movement (thalamus). An electrode attached to an insulated lead wire is implanted in the brain; the battery power source is implanted under the skin of the chest, and an extension wire is tunneled under the skin to connect the battery to the lead. The patient turns on the power source to deliver the electrical impulse and interrupt the tremor.

TREPHINE. A small surgical instrument that is rotated to cut a circular incision.

TREPONEMA PALLIDUM. The spirochete bacterium that causes syphilis.

TRETINOIN. A naturally occurring retinoid, derived from vitamin A, that treats acne by increasing the turnover (death and replacement) of skin cells.

TRIANGLING. A process in which two family members lower the tension level between them by drawing in a third member.

TRICHIASIS. A disease of the eye, in which the eyelashes, being turned in upon the eyeball, produce constant irritation by the motion of the lids.

TRICHINA. An individual example of *Trichinella spiralis*.

TRICHINOSIS. A roundworm infection, usually contracted by eating raw or undercooked meat. Trichinosis is rare in the United States but a common infection in some parts of the world.

TRICHOTILLOMANIA. An impulse or compulsion to pull out one's own hair.

TRICUSPID VALVE. A fold in between the right atrium and the right ventricle of the heart that directs blood that needs oxygen to the lungs.

TRIDOSHA. The combination of three basic principles of energy, or biological humor, that comprise life, according to Ayurvedic philosophy.

TRIGEMINAL NEURALGIA. Brief episodes of severe shooting pain on one side of the face caused by inflammation of the root of the trigeminal nerve. Also referred to as tic douloureux.

TRIGLYCERIDE. A substance formed in the body from fat in the diet. Triglycerides are the main fatty materials in the blood. Together with protein, they make up high- and low-density lipoproteins (HDLs and LDLs). Triglyceride levels are important in the diagnosis and treatment of many diseases including high blood pressure, diabetes, and heart disease.

TRIIODOTHYRONINE (T_3). A thyroid hormone similar to thyroxine but more powerful. Preparations of triiodothyronine are used in treating hypothyroidism.

TRIMESTER. The first third or 13 weeks of pregnancy.

TRIMETHOPRIM-SULFAMETHOXAZOLE (TMP-SMX). An antibiotic used to treat and prevent PCP.

TRINUCLEOTIDE REPEAT EXPANSION. A sequence of three nucleotides that is repeated too many times in a section of a gene.

TRIPLOIDY. The condition where an individual has three entire sets of chromosomes instead of the usual two.

TRISOMY. An abnormal condition where three copies of one chromosome are present in the cells of an individual's body instead of two, the normal number.

(c) 2011 Cengage Learning. All Rights Reserved.

TRITURATION. The process of diluting a nonsoluble substance for homeopathic use by grinding it to a fine powder and mixing it with lactose powder.

TROCAR. A small sharp instrument used to puncture the abdomen at the beginning of the laparoscopic procedure.

TROPHOBLAST. The tissues that surround an embryo and attach it to the uterus.

TROPHOZOITE. The active feeding stage of a protozoal parasite, as distinct from its encysted stage.

TRYPTOPHAN. An essential amino acid that has to consumed in the diet because it cannot be manufactured by the body. Tryptophan is converted by the body to niacin, one of the B vitamins.

TUBAL LIGATION. A surgical procedure in which the fallopian tubes are tied in two places and cut between. This prevents eggs from moving from the ovary to the uterus.

TUBAL PREGNANCY. Pregnancy in one of the fallopian tubes.

TUBE ENTEROSTOMY. An enterostomy performed to allow the insertion of a feeding tube into the jejunum or stomach.

TUBERCULIN. A mixture of antigens obtained from the cultured bacteria that cause tuberculosis, *Mycobacterium tuberculosis*.

TUBERCULOMA. A tumor-like mass in the brain that sometimes develops as a complication of tuberculosis meningitis.

TUBERCULOSIS. An infectious disease that usually affects the lungs, but may also affect other parts of the body. Symptoms include fever, weight loss, and coughing up blood.

TUBEROUS SCLEROSIS. A genetic disease that causes skin problems, seizures, and mental retardation. Autism occurs more often in individuals with tuberous sclerosis.

TUBULAR CARCINOMA. A type of cancer that accounts for approximately 1% to 2% of breast cancers. Can appear small on ultrasound or mammogram.

TUBULAR KIDNEY DISEASE. Disease of the kidney that affect the tubules, the part of the kidney that allows certain substances to be reabsorbed back into the blood.

TUBULE. A very small tube-shaped structure in the nephron of the kidney that removes certain ions and molecules from the blood and deposits them into the fluid within the tubule.

TUMOR. An abnormal growth resulting from a cell that lost its normal growth control restraints and started multiplying uncontrollably.

TUMOR LYSIS SYNDROME. A side effect of some immunotherapies, like monoclonal antibodies, that lyse the tumor cells, due to the toxicity of flooding the bloodstream with such a quantity of cellular contents.

TUMOR MARKERS. Biochemicals produced by tumor cells or by the body in response to tumor cells. Their levels in the blood help evaluate people for certain kinds of cancer.

TUMOR-SUPPRESSOR GENE. Gene involved in controlling normal cell growth and preventing cancer.

TUNICA ALBUGINEA. The sheath of elastic tissue enclosing the corpora cavernosa.

TUNICA VAGINALIS. A sac-like membrane covering the outer surface of the testis.

TURBIDIMETRY. A technique of measurement that analyzes the amount of sediment in a liquid.

TURBIDITY. The cloudiness or lack of transparency of a solution.

TURBINADO SUGAR. A type of sugar made from sugar cane extract. It resembles light brown sugar in color but is paler and has larger crystals. It is called demerara sugar in the United Kingdom.

TURBINATE. Ridge-shaped cartilage or soft bony tissue inside the nose.

TURNER'S SYNDROME. A disorder in women caused by an inherited chromosomal defect. This disorder inhibits sexual development and causes infertility. A symptom is absence of menstruation.

TWILIGHT ANESTHESIA. An intravenous mixture of sedatives and other medications that decreases patients' awareness of the procedure being performed.

TWIN REVERSED ARTERIAL PERFUSION (TRAP) SEQUENCE. A condition in which one fetus lacks a heart and the other fetus pumps the blood for both.

TWIN-TO-TWIN TRANSFUSION SYNDROME (TTTS). A condition in monochorionic twins in which there is a connection between the two circulatory systems so that the donor twin pumps the blood to the recipient twin without a return of blood to the donor.

TYMPANIC MEMBRANE. The eardrum. A thin disc of tissue that separates the outer ear from the middle ear.

(c) 2011 Cengage Learning. All Rights Reserved.

TYMPANOSTOMY TUBE. Ear tube. A small tube made of metal or plastic that is inserted during myringotomy to ventilate the middle ear.

TYPE 1 DIABETES. A chronic immune system disorder in which the pancreas does not produce sufficient amounts of insulin, a hormone that enables cells to use glucose for energy. Also called juvenile diabetes, it must be treated with insulin injections.

TYPE 2 DIABETES. Sometimes called adult-onset diabetes, this disease prevents the body from properly using glucose (sugar), but can often be controlled with diet and exercise.

TYPHOID FEVER. An infectious disease caused by a type of bacterium. People with this disease have a lingering fever and feel depressed and exhausted. Diarrhea and rose-colored spots on the chest and abdomen are other symptoms. The disease is spread through poor sanitation.

TYPICAL USE. A measurement of the effectiveness of a contraceptive that counts all users, including those who use the method incorrectly or only occasionally.

TYROSINASE. An enzyme in a pigment cell which helps change tyrosine to DOPA during the process of making melanin.

TYROSINE. A protein building block found in a wide variety of foods that is used by the body to make melanin.

TZANCK PREPARATION. A procedure in which skin cells from a blister are stained and examined under the microscope.

U

UDANA. Life sustaining energy of the diaphragm, the third of the five airs of Ayurvedic philosophy, the life force governing upward motion.

ULCER. An open sore on the skin, resulting from tissue destruction, that is usually accompanied by redness, pain, or infection.

ULCERATED. Damaged so that the surface tissue is lost and/or necrotic (dead).

ULCERATION. A pitted area or break in the continuity of a surface, such as the skin or mucous membrane.

ULCERATIVE COLITIS. A disease of the colon characterized by inflammation of the mucous lining, ulcerated areas of tissue, and bloody diarrhea.

ULTRASONOGRAM. A procedure in which high-frequency sound waves that cannot be heard by human ears are bounced off internal organs and tissues. These sound waves produce a pattern of echoes that are then used by the computer to create sonograms or pictures of areas inside the body.

ULTRASONOGRAPHER. The person who performs the radiologic technique of ultrasound in which deep structures of the body are visualized.

ULTRASONOGRAPHY. Imaging test using sound waves to view internal organs and tissues.

ULTRASOUND. An imaging technique that uses sound waves to generate a picture of an internal structure in the body.

ULTRASOUND SCAN. The scan produces images of arteries on a screen and is used to evaluate the blood flow, locate blockages, and measure the size of the artery.

ULTRASOUND WAVES. High frequency sound waves.

ULTRAVIOLET (UV) LIGHT. A portion of the light spectrum not visible to the eye. It is damaging to living material, especially eyes and DNA.

ULTRAVIOLET RADIATION (UV). Invisible light rays that may be responsible for sunburns, skin cancers, and cataract formation.

UMBILICAL. Referring to the opening in the abdominal wall where the blood vessels from the placenta enter.

UMBILICAL CORD. The blood vessels that allow the developing baby to receive nutrition and oxygen from its mother; the blood vessels also eliminate the baby's waste products. One end of the umbilical cord is attached to the placenta and the other end is attached to the baby's belly button (umbilicus).

UMBILICAL CORD BLOOD TRANSPLANT. A procedure in which the blood from a newborn's umbilical cord, which is rich in stem cells, is used as the donor source for bone marrow transplants.

UMBILICUS. The area where the umbilical cord was attached; also known as the navel or belly button.

UNIFOCAL. Only one tumor present in one eye.

UNILATERAL. Located on or affecting only one side of the body.

(c) 2011 Cengage Learning. All Rights Reserved.

UNIPARENTAL DISOMY. Chromosome abnormality in which both chromosomes in a pair are inherited from the same parent.

UNRESECTABLE CANCER. A tumor that cannot be completely removed by surgery.

UNSATURATED FAT. Fat found in plant foods that is typically liquid (oil) at room temperature. They can be monounsaturated or polyunsaturated, depending on the chemical structure. Unsaturated fats are the most recommended dietary fats.

UPPER ENDOSCOPY. A medical procedure in which a thin, lighted, flexible tube (endoscope) is inserted down the patient's throat. Through this tube the doctor can view the lining of the esophagus, stomach, and the upper part of the small intestine.

URATE CRYSTALS. Crystals formed by high levels of uric acid in the blood.

UREA. A compound containing nitrogen that occurs in the urine and other body fluids as a result of protein metabolism.

UREMIA. The presence of excessive amounts of urea and other waste products in the blood.

UREMIC POISONING. Accumulation of waste products in the body.

URETER. The tube-like passageway in the body that carries urine from the kidney to the bladder.

URETERAL STENT. A surgical device implanted in patients with damaged ureters that holds the ureter open so that urine can flow freely from the kidneys to the bladder.

URETEROVESICAL JUNCTION. The joining of the ureter to the bladder.

URETEROVESICAL VALVE. A sphincter (an opening controlled by a circular muscle), located where the ureter enters the bladder, that keeps urine from flowing backward toward the kidney.

URETHRA. The tube that carries urine from the bladder to outside the body. In females, the urethral opening is between the vagina and clitoris; in males, the urethra travels through the penis, opening at the tip.

URETHRA HYPERMOBILITY. Main factor in stress urinary incontinence, with severity based upon how far the urethra has descended into the pelvic floor through herniation or cystocele.

URETHRAL MEATUS. This is the external opening of the urethra.

URETHRAL STRICTURE. A narrowing of the urethra (urine tube).

URETHRITIS. Inflammation of the urethra.

URETOSCOPE. A tube-shaped device inserted into the body through the urinary system that allows objects to be both seen and grasped for removal.

URIC ACID. A compound resulting from the body's breakdown of purine. It is normally present in human urine only in small amounts.

URICOSURIA. Increased levels of uric acid in the urine.

URINALYSIS (PLURAL, URINALYSES). The diagnostic testing of a urine sample.

URINARY INCONTINENCE. The inability to control one's urine flow.

URINARY RETENTION. The result of progressive obstruction of the urethra by an enlarging prostate, causing urine to remain in the bladder even after urination.

URINARY TRACT. The passage through which urine flows from the kidneys out of the body.

URINE. The fluid containing water and waste products that is produced by the kidneys, stored in the bladder, and removed from the body through the urethra.

URINE DIPSTICK TEST. A test using a small, chemically treated strip that is dipped into a urine sample; when testing for protein, an area on the strip changes color depending on the amount of protein (if any) in the urine.

UROGENITAL. Both the urinary system and the sexual organs, which form together in the developing embryo.

UROGYNECOLOGIST. A physician that specializes in female medical conditions concerning the urinary and reproductive systems.

UROLOGIST. A physician who specializes in problems of the urinary system.

URORADIOLOGIST. A radiologist that specializes in diagnostic imaging of the urinary tract and kidneys.

UROSTOMY. A surgical opening (a stoma) created to divert urine to the outside of the body for collection once the bladder has been removed.

UROTHELIUM. The lining of the urinary tract, including the renal pelvis, ureters, bladder, and urethra.

(c) 2011 Cengage Learning. All Rights Reserved.

UTERINE FIBROID. A noncancerous tumor of the uterus that can range from the size of a pea to the size of a grapefruit. Small fibroids require no treatment, but those causing serious symptoms may need to be removed.

UTERINE PROLAPSE. Bulging of the uterus into the vagina.

UTERUS. The hollow, muscular female organ that supports the development and nourishment of the unborn baby during pregnancy.

UVEA. The middle of the three coats of tissue surrounding the eye, comprising the choroid, iris, and ciliary body. The uvea is pigmented and well supplied with blood vessels.

UVEAL TRACT. The pigmented membrane that lines the back of the retina of the eye and extends forward to include the iris. The uveal tract is sometimes called the uvea and has three parts: the iris, the choroid, and the ciliary body.

UVEITIS. Inflammation of the area of the eye around the pupil.

UVULOPALATOPHARYNGOPLASTY (UPPP). An operation to remove excess tissue at the back of the throat to prevent it from closing off the airway during sleep.

V

VACCINATION. Injection of a killed or weakened microbe in order to stimulate the immune system against the microbe, thereby preventing disease. Vaccinations, or immunizations, work by stimulating the immune system, the natural disease-fighting system of the body. The healthy immune system is able to recognize invading bacteria and viruses and produce substances (antibodies) to destroy or disable them. Vaccinations prepare the immune system to ward off a disease. To immunize against viral diseases, the virus used in the vaccine has been weakened or killed.

VACCINE. A preparation using a non-infectious element or relative of a particular virus or bacteria, administered with the intention of halting the progress of an infection or completely preventing it.

VAGINA. The birth canal; the passage from the cervix of the uterus to the opening leading outside of a woman's body.

VAGINAL DISCHARGE. Discharge of secretions from the cervical glands of the vagina; normally clear or white.

VAGINAL PROLAPSE. Bulging of the top of the vagina into the lower vagina or outside the opening of the vagina.

VAGINAL STENOSIS. Narrowing of the vagina due to a buildup of scar tissue.

VAGINAL YEAST INFECTION. An overgrowth of fungus in the vaginal area.

VAGINISMUS. A painful spasmodic vaginal contraction.

VAGINITIS. Inflammation of the vagina.

VAGOTOMY. Cutting of the vagus nerve. If the vagus nerves are cut as they enter the stomach (truncal vagotomy), gastric secretions are decreased, as is intestinal motility (movement) and stomach emptying. In a selective vagotomy, only those branches of the vagus nerve are cut that stimulate the secretory cells.

VAGUS NERVE. Cranial nerves that supply the internal organs (viscera).

VALACYCLOVIR. An oral antiviral drug that blocks the replication of the varicella zoster virus.

VALSALVA MANEUVER. Pilots grunt and tighten their abdominal muscles to prevent black outs during high-performance flying.

VALVE. Tissue in the passageways between the heart's upper and lower chambers that controls passage of blood and prevents regurgitation.

VALVULAR. Having to do with the valves inside the heart.

VALVULAR HEART DISEASE. A disease of any one of the four valves that controls blood flow into, through, and out of the heart.

VAPORIZE. To dissolve solid material or convert it into smoke or gas.

VARIABLE DECELERATION. Fetal bradycardia below 100 beats per minute denoting compression of the umbilical cord at the height of a uterine contraction.

VARICELLA. Chickenpox; a disease caused by the *Varicella zoster* virus—human herpes virus 3—that can cause severe birth defects if transmitted to the fetus during the first 20 weeks of pregnancy and newborn complications if it is transmitted perinatally.

VARICELLA–ZOSTER IMMUNE GLOBULIN (VZIG). A substance that can reduce the severity of chickenpox symptoms.

VARICES. Swollen or enlarged veins.

(c) 2011 Cengage Learning. All Rights Reserved.

VARICOCELE. An abnormal enlargement of the veins which drain the testicles.

VARICOSE VEINS . Twisted, enlarged veins near the surface of the skin, which develop most commonly in the legs and ankles.

VARIEGATION. Patchy variation in color.

VAS DEFERENS. The duct that stores sperm and carries it from the epididymis to the ejaculatory duct.

VASCULAR. Pertaining to blood vessels.

VASCULITIS. An inflammation of the blood vessels.

VASCULOGENIC ERECTILE DYSFUNCTION. The inability to attain or sustain an erection satisfactory for coitus, due to atherosclerotic disease of penile arteries, inadequate impedance of venous outflow (venous leaks), or a combination of both.

VASECTOMY. Surgical sterilization of the male, done by removing a portion of the tube that carries sperm to the urethra.

VASOCONSTRICTION. Constriction of a blood vessel.

VASODILATATION. The increase in the internal diameter of a blood vessel that results from relaxation of smooth muscle within the wall of the vessel thus causing an increase in blood flow.

VASODILATOR. A class of drugs that widen the blood vessels, that in turn decreases resistance to blood flow and lowers blood pressure.

VASOPRESSORS. Medications that constrict the blood vessels.

VASOSPASM. Narrowing of a blood vessel caused by a spasm of the smooth muscle of the vessel wall.

VASOVAGAL REACTION. Regarding the action of stimuli from the vagus nerve on blood vessels.

VATA. One of the three main constitutional types found under Ayurvedic principles. Keeping one's particular constitution in balance is considered important in maintaining health.

VBAC. Vaginal birth after cesarean.

VECTOR. An animal carrier that transfers an infectious organism from one host to another.

VEGETATION. An abnormal growth of tissue around a valve, composed of blood platelets, bacteria, and a protein involved in clotting.

VEIN. A blood vessel that returns oxygen-depleted blood from various parts of the body to the heart.

VENA CAVA. The large vein that drains directly into the heart after gathering incoming blood from the entire body.

VENEREAL DISEASE. Another term for sexually transmitted disease.

VENESECTION. Another name for phlebotomy.

VENOARTERIAL (V-A) BYPASS. The type of ECMO that provides both heart and lung support, using two tubes (one in the jugular vein and one in the carotid artery).

VENOM. A poisonous substance secreted by an animal, usually delivered through a bite or a sting.

VENOUS STASIS DISEASE. A condition in which there is pooling of blood in the lower leg veins that may cause swelling and tissue damage, and lead to painful sores or ulcers.

VENOVENOUS (V-V) BYPASS. The type of ECMO that provides lung support only, using a tube inserted into the jugular vein.

VENTILATOR. A mechanical device that can take over the work of breathing for a patient whose lungs are injured.

VENTRICLES. The two chambers of the heart that are involved in pumping blood. The right ventricle pumps blood into the lungs to receive oxygen. The left ventricle pumps blood into the circulation of the body to deliver oxygen to all of the body's organs and tissues.

VENTRICULAR FIBRILLATION. A condition in which the lower chamber of the heart quivers instead of pumping in an organized way.

VENTRICULAR SEPTAL DEFECT (VSD). A defect or opening in the ventricular septum, the wall of tissue that separates the two lower chambers of the heart.

VENTRICULAR TACHYCARDIA. A rapid heartbeat, usually more than 100 beats per minute.

VERMILION BORDER. The line between the lip and the skin.

VERTEBRA (PLURAL, VERTEBRAE). One of the bones of the spinal column. There are 33 vertebrae in the human spine.

VERTEBRAL COLUMN. The vertebral column, also called the spinal column or spine, consists of a series of vertebrae connected by ligaments. It provides a supporting axis for the body and protects the spinal cord. The vertebral column consists of seven cervical vertebrae in the neck, followed by 12 thoracic vertebrae that

(c) 2011 Cengage Learning. All Rights Reserved.

connect to the ribs, five lumbar vertebrae in the lower back, the sacrum, and the coccyx.

VERTEBROBASILAR ARTERIES. Major blood vessels that lead to the brain. They are located at the base of the skull at the back of the head.

VERTIGO. The sensation of moving around in space, or objects moving around a person. It is a disturbance of equilibrium.

VESICLE. A bump on the skin filled with fluid.

VESTIBULAR SYSTEM. The brain and parts of the inner ear that work together to detect movement and position.

VESTIBULECTOMY. Surgical removal of the vestibule and hymen.

VESTIBULOCOCHLEAR NERVE (EIGHTH CRANIAL NERVE). Nerve that transmits information, about hearing and balance from the ear to the brain.

VIAGRA. Trade name of an orally administered drug for erectile failure first cleared for marketing in the United States in March 1998. Its generic name is sildenafil citrate.

VIBRATION. A procedure to help break up lung secretions, performed as the patient breathes deeply. When done manually, the person performing the vibration places his or her hands against the patient's chest and creates vibrations by quickly contracting and relaxing arm and shoulder muscles while the patient exhales. The procedure is repeated several times each day for about five exhalations.

VIBROACOUSTIC STIMULATION. In the biophysical profile, use of an artificial larynx to produce a loud noise to "awaken" the fetus.

VIDEO-ASSISTED THORACIC SURGERY (VATS). A technique used to aid in the placement of chest tubes or when performing decortications when treating advanced empyema.

VIDEOSCOPE. A surgical camera.

VILLI. Tiny, finger–like projections that enable the small intestine to absorb nutrients from food.

VIRAL LOAD. A measure of the severity of a viral infection, calculated by estimating the number of copies of the virus in a milliliter of blood.

VIRAL LOAD TEST. A new blood test for monitoring the speed of HIV replication in AIDS patients. The viral load test is based on PCR techniques and supplements the CD4+ cell count tests.

VIRTUAL COLONOSCOPY. Two new techniques that provide views of the colon to screen for colon polyps and cancer. The images are produced by computerized manipulations rather than direct observation through the colonoscope; one technique uses the X-ray images from a CT scan, and the other uses magnetic images from an MRI scan.

VIRUS. A tiny, disease-causing structure that can reproduce only in living cells and causes a variety of infectious diseases.

VISCERA. Any of the body's organs located in the chest or abdomen.

VISCERAL LARVA MIGRANS (VLM). Another name for toxocariasis. The name is derived from the life cycle of the organism.

VISUAL ACUITY. Sharpness or clearness of vision.

VISUAL ACUITY TEST. An eye examination that determines sharpness of vision, typically performed by identifying objects and/or letters on an eye chart.

VISUALIZATION. The process of making an internal organ visible. A radiopaque subtance is introduced into the body, then an x-ray picture of the desired organ is taken.

VISUAL-MOTOR SKILLS. Hand-eye coordination; in the Bender-Gestalt test, visual-motor skills are measured by the subject's ability to accurately perceive and then reproduce figures.

VISUAL-PERCEPTUAL SKILLS. The capacity of the mind and the eye to "see" something as it objectively exists.

VITAL CAPACITY (VC). The largest amount of air expelled after one's deepest inhalation.

VITAL SIGNS. Basic indicators of body function, usually meaning heartbeats per minute, breaths per minute, blood pressure, body temperature, and weight.

VITAMIN. An essential nutrient the body needs in small amounts to remain healthy but that the body cannot manufacture for itself and must acquire through diet.

VITAMIN D. Any of several fat-soluble vitamins that are required for normal bone and teeth structure and various other physiological functions. Vitamin D is obtained from some foods and is produced in the body through the action of ultraviolet radiation.

VITAMIN STATUS. Vitamin status refers to the state of vitamin sufficiency or deficiency of any person. For example, a test may reveal that a patient's folate status is sufficient, borderline, or severely inadequate.

(c) 2011 Cengage Learning. All Rights Reserved.

VITILIGO. A chronic skin disorder that causes loss of pigmentation (color) from patches of skin, most often on the face, hands, and wrists.

VITREOUS. The transparent gel that fills the back part of the eyeball, behind the lens; also referred to as the vitreous body.

VITREOUS HUMOR. The clear gel-like substance that fills the eyeball behind the lens.

VITREOUS SEEDING. When small pieces of tumor have broken off and are floating around the vitreous.

VOICE BOX. The larynx.

VOIDING. Another word for emptying the bladder or urinating.

VOLATILE. Something that vaporizes or evaporates quickly when exposed to air.

VOLATILE ORGANIC COMPOUNDS. VOCs, a large class of carbon-based chemicals that release gases into the air as they evaporate at room temperature. Found both in natural sources such as living trees, decomposing vegetation, and crude oil, and in manmade sources such as solvents, adhesives, and gasoline, VOCs help form ozone at ground levels and are major air contaminants.

VOLATILE SOLVENTS. Liquids that vaporize at room temperature, including a variety of industrial and household products and art and office-supply solvents.

VOLTAGE. The force necessary to drive an electric current between two specified points. A large voltage exerts a greater force, which moves more electrons through a wire at a given rate of time.

VOLUNTARY. An action or thought undertaken or controlled by a person's free will or choice.

VOLUNTARY MUSCLE. A muscle under conscious control, such as arm and leg muscles.

VOLVULUS. A twisting of the intestine that causes an obstruction.

VON WILLEBRAND FACTOR (VWF). A protein found in the blood that is involved in the process of blood clotting.

VON WILLEBRAND'S DISEASE. An inherited lifelong bleeding disorder caused by an abnormal gene, similar to hemophilia. The gene defect results in a decreased blood concentration of a substance called von Willebrand's factor (vWF).

VOYEURISM. Sexual stimulation by visual means, usually by observing an unsuspecting individual.

VULVA. The external female genitalia including the mons pubis, labia majora and minora, clitoris, vestibule, glands, and the vaginal opening.

VULVAR VESTIBULITIS. A localized inflammation of the vestibule—the region immediately surrounding the opening of the vagina and the urethra.

VULVODYNIA. A chronic burning, stinging, or irritation of the vulva.

VYANA. Life sustaining energy of the heart and lungs; the second of the five airs of Ayurvedic philosophy; the life force governing circular motion.

W

WARFARIN. A drug that reduces the ability of the blood to clot.

WART. A raised growth on the surface of the skin or other organ.

WARTHIN'S TUMOR. A benign tumor of the parotid gland.

WASTING SYNDROME. A combination of weight loss and change in composition of body tissues that occurs in patients with HIV infection. Typically, the patient's body loses lean muscle tissue and replaces it with fat as well as losing weight overall.

WATER BRASH. The flow of saliva and stomach acid back up the esophagus and into the throat or lungs.

WATER HOMEOSTASIS. A condition of adequate fluid level in the body in which fluid loss and fluid intake are equally matched and sodium levels are within normal range.

WATER INTOXICATION. A potentially life-threatening condition caused by drinking too much water, which leads to hyponatremia and may result in seizures, coma, and death.

WATER-SOLUBLE VITAMINS. Vitamins that are not stored in the body and are easily excreted. They must, therefore, be consumed regularly as foods or supplements to maintain health.

WBC DIFFERENTIAL. A white blood cell count in which the technician classifies the different white blood cells by type as well as calculating the number of each type. A WBC differential is necessary to calculate the absolute CD4+ lymphocyte count.

(c) 2011 Cengage Learning. All Rights Reserved.

WEBER TEST. A hearing test using a vibrating tuning fork which is held at various points along the midline of the skull and face.

WEGENER'S GRANULOMATOSIS. A disease usually affecting males that causes the infiltration of inflammatory cells and tissue death in the lungs, kidneys, blood vessels, heart, and other tissues.

WERNICKE-KORSAKOFF SYNDROME. A combination of symptoms, including eye-movement problems, tremors, and confusion, that is caused by a lack of the B vitamin thiamine and may be seen in alcoholics.

WERNICKE'S APHASIA. A condition characterized by either partial or total loss of the ability to understand what is being said or read. The individual maintains the ability to speak, but speech may contain unnecessary or made-up words.

WESTERN BLOT. A procedure that uses electrical current passed through a gel containing a sample of tissue extract in order to break down the proteins in the sample and detect the presence of antibodies for a specific disease. The Western blot method is used in HIV testing to confirm the results of an initial screening test.

WHEEZE. A whistling sound made by the flow of high-velocity air through narrowed airways. Wheezing is a symptom of several respiratory diseases including byssinosis and asthma.

WHIPPLE PROCEDURE. Surgical removal of the head of the pancreas, part of the small intestine, and some surrounding tissue.

WHIPPLE'S DISEASE. A disorder of impaired absorption of nutrients by the small intestine. Symptoms include diarrhea, abdominal pain, progressive weight loss, joint pain, swollen lymph nodes, abnormal skin pigmentation, anemia, and fever. The precise cause is unknown, but it is probably due to an unidentified bacterial infection.

WHIPWORM. A nematode worm of the family Trichuridae with a body that is thick at one end and very long and slender at the other end.

WHITE BLOOD CELL (LEUKOCYTE; WBC). A blood cell that is responsible for fighting infection.

WHOLE BLOOD. Blood that contains red blood cells, white blood cells, and platelets in plasma.

WHOOPING COUGH. An infectious disease, also called pertussis, especially of children that is caused by a bacterium and is marked by a convulsive, spasmodic cough, sometimes followed by a shrill intake of breath.

WILDCRAFTING. Gathering of herbs or other natural materials.

WILDERNESS. Large backcountry areas lacking roads, communication and other modern infrastructure.

WILSON'S DISEASE. A genetic disorder in which copper accumulates in the body, leading to liver disease and a variety of neurological and psychiatric symptoms.

WINDOW OPERATION. Cutting out a large oval-shaped piece of the cyst wall and putting in stitches to create a window so the cyst cannot reoccur.

WINDOW PERIOD. The period of time between a person's getting infected with HIV and the point at which antibodies against the virus can be detected in a blood sample.

WIRELESS CAPSULE ENDOSCOPY. A newer method of examining the small bowel by means of a capsule swallowed by the patient. The capsule contains a miniaturized lens and an antenna that transmits information to a belt-pack recorder worn by the patient during the day.

WISDOM TOOTH. One of the four last teeth on the top and bottom rows of teeth. Also called a third molar.

WITHDRAWAL. Physical symptoms and psychological discomforts experienced after a person suddenly stops using a drug on which he or she has become dependent.

"WHEAL AND FLARE" REACTION. A rapid response to a skin allergy test characterized by the development of a red, itching spot in the area where the allergen was injected.

WOLFF-PARKINSON-WHITE SYNDROME. An abnormal, rapid heart rhythm, due to an extra pathway for the electrical impulses to travel from the atria to the ventricles.

WOOD'S LAMP. A special lamp that uses ultraviolet light to detect certain types of skin infections and infestations. It was invented in 1903 by a physicist named Robert Wood.

WORD CATHETER. A small rubber catheter with an inflatable balloon tip that is inserted into a stab incision in the cyst, after the contents of the cyst have been drained.

WORD SALAD. Speech that is so disorganized that it makes no linguistic or grammatical sense.

WORKING MEMORY. The memory system that relates to the task at hand and coordinates recall of memories necessary to complete it.

(c) 2011 Cengage Learning. All Rights Reserved.

WOUND. Any injury that breaks the skin, including cuts, scratches, and puncture wounds.

WRIGHT'S STAIN. A chemical used to stain tissue samples for laboratory analysis.

X

X CHROMOSOME. One of the two types of sex chromosomes; females have two X chromosomes, while males have one X chromosome and one Y chromosome.

X RAY. A form of electromagnetic radiation with shorter wavelengths than normal light. X rays can penetrate most structures.

XANTHOMAS. Fatty yellow patches or nodules on the skin or internal tissues.

XENOGRAFT. Tissue that is transplanted from one species to another (e.g., pigs to humans).

XENOTRANSPLANT. Transplantation of animal cells or tissues into a human.

XERODERMA PIGMENTOSUM. A genetic disease characterized by the inability to repair damaged DNA. Individuals with this disease develop an excessive number of skin cancers.

XEROPHTHALMIA. A drying of the cornea and conjunctiva.

XEROSTOMIA. The medical term for dry mouth.

X-LINKED. Refers to a gene carried on the X chromosome, one of the two sex chromosomes.

X-LINKED DOMINANT INHERITANCE. The inheritance of a trait by the presence of a single gene on the X chromosome in a male or female, passed from an affected female who has the gene on one of her X chromosomes.

X-LINKED GENE. A gene carried on the X chromosome, one of the two sex chromosomes.

X-LINKED HYPOPHOSPHATEMIA,. A type of rickets caused by genetic factors which prevent the kidneys from retaining phosphate.

X-LINKED RECESSIVE INHERITANCE. The inheritance of a trait by the presence of a single gene on the X chromosome in a male, passed from a female who has the gene on one of her X chromosomes, and who is referred to as an unaffected carrier.

Y

YELLOW FEVER. An infectious disease caused by a virus. The disease, which is spread by mosquitoes, is most common in Central and South America and Central Africa. Symptoms include high fever, jaundice (yellow eyes and skin) and dark-colored vomit, a sign of internal bleeding. Yellow fever can be fatal.

YIN/YANG. Complimentary universal characteristics used to describe aspects of the natural world.

YOGA. A system of exercise aimed at promoting the control of the body and the mind.

YOGI (FEMALE, YOGINI). A trained practitioner of yoga.

YOLK SAC. A sac made of membranous tissue which is attached to the embryo and which provides nutrition to the embryo.

YUZPE REGIMEN. A form of emergency contraception in which two oral contraceptive pills that contain both of the hormones estrogen and progestin are taken to prevent pregnancy.

Z

ZAFIRLUKAST (ACCOLATE). An inhibitor that prevents leukotrienes from binding to cell receptors; taken over time, zafirlukast can help reduce or prevent asthma symptoms.

ZELLWEGER SPECTRUM. Three peroxisome biogenesis disorders—Zellwinger syndrome, neonatal adrenoleukodystrophy, and infantile Refsum disease—which can be caused by different mutations in the same genes and which differ only in the severity of the resulting condition.

ZEN. A form of meditation that emphasizes direct experience.

ZIFT. Stands for zygote intrafallopian tube transfer. In in vitro fertilization, the eggs are fertilized in a laboratory dish and then placed in the woman's fallopian tube.

ZILEUTON (ZYFLO). A medication that interferes with the biosynthetic pathway that produces leukotrienes; used to help prevent asthma attacks.

ZOLLINGER-ELLIZON SYNDROME. Severe peptic ulceration from excessive stomach acid production stimulated by one or more tumors that produce a powerful acid secretion.

(c) 2011 Cengage Learning. All Rights Reserved.

ZONE THERAPY. Also called zone analgesia, a method of relieving pain by applying pressure to specific points on the body. It was developed in the early twentieth century by Dr. William Fitzgerald.

ZOONOSIS (PLURAL, ZOONOSES). Any disease of animals that can be transmitted to humans under natural conditions. Lyme disease, rabies, psittacosis (parrot fever), cat-scratch fever, and monkeypox are examples of zoonoses.

ZOONOTIC DISEASES. Diseases caused by infectious agents that can be transmitted between (or are shared by) animals and humans. This can include transmission through the bite of an insect, such as a mosquito.

ZYGOMYCOSIS. Another term for mucormycosis. The fungi that cause mucormycosis belong to a group called Zygomycetes.

ZYGOTE. A fertilized egg.

(c) 2011 Cengage Learning. All Rights Reserved.

INDEX

In the index, references to individual volumes are listed before colons; numbers following a colon refer to specific page numbers within that particular volume. **Boldface** references indicate main topical essays. Photographs and illustration references are highlighted with an *italicized* page number, and tables are also indicated with the page number followed by a lowercase, italicized *t*.

A

A beta 42, 1:174
A/G ratio (Albumin/globulin ratio), 5:3595–3596
A-mode ultrasound, 1:4, 2:1650
A-T Project Foundation, 1:513
A-V block, infranodal, 1:795
A1AT (Alpha 1-antitrypsin) deficiency, 2:1524–1530, 4:2631
A1c hemoglobin, 3:1911
AA (Alcoholics Anonymous), 1:59–60, 5:4197
AABB (American Association of Blood Banks), 1:681, 6:4395
AAC (Augmented and alternative communication), 5:4074, 4075
AACAP (American Academy of Child and Adolescent Psychiatry), 4:2971, 3155
AAMFT (American Association for Marriage and Family Therapy), 3:1682, 4:2765, 2766
AAMI (Age-associated memory impairment), 2:1302, 1305, 5:3901
AANP (American Association of Naturopathic Physicians), 4:3038
AAOG (American Academy of Obstetrics and Gynecology), 5:4162
AAOS. *See* American Academy of Orthopaedic Surgeons
AASEC (American Association of Sexual Educators, Counselors, and Therapists), 5:3935
AAT (Alpha-1-antitrypsin), 2:1026, 1027
Abacavir, 1:98, 411–413
Abana, 3:2423
Abarelix, 1:291–295
Abatacept, 3:2454
Abbokinase. *See* Urokinase
ABC. *See* Abacavir
ABCC6 gene, 5:3611, 3612
ABCDE (Airway, Breathing, Circulation, Disability, and Exposure) assessment, 6:4661–4662
ABCDE rule, 4:2733–2734, 2895, 5:4010, 6:4624
ABCR drugs, 4:2947–2948
ABC's of resuscitation, 4:2600–2601
Abdominal adhesions, 1:67–71
Abdominal aortic aneurysm, 1:2, 244, 435, 6:4552, 4553, 4554
Abdominal hernia, 3:1827, *2106,* 2106–2108, 5:3480
Abdominal hysterectomy, 3:2263–2264, 4:3152, 5:3837
Abdominal pain
  causes
    appendicitis, 1:454, 455
    exocrine pancreatic cancer, 5:3260
    extracorporeal shock-wave lithotripsy, 4:2624
    familial Mediterranean fever, 3:1675
    ileus, 3:2284
    intussusception, 3:2408
    irritable bowel syndrome, 3:2419
    obstetrical emergencies, 4:3132
    ovarian torsion, 4:3222–3223
    pancreatitis, 5:3266, 3268
  recurrent, 5:4142, 4143, 4145
  ultrasound for, 1:1
  See also Stomachache
Abdominal pregnancy. *See* Ectopic pregnancy
Abdominal surgery, laparoscopic, 4:2532
Abdominal thrust. *See* Heimlich maneuver
Abdominal trauma, 1:1, 2:1574, 3:1818, 5:4099
Abdominal ultrasound, 1:**1–5,** 112, 4:3132, 6:4413
Abdominal wall defects, 1:**5–6**
Abdominoperineal resection, 1:217, 5:3704
Abdominoplasty, 5:*3434,* 3435, 3436
Abeximag, 1:334–337
Abetalipoproteinemia, 3:2243
ABGC (American Board of Genetic Counseling), 3:1863–1864
ABI (Ankle-brachial index) test, 3:2386, 2387, 6:4548
ABIDE (Association of Body Image and Disordered Eating), 1:691
Abilify. *See* Aripiprazole
Abitrate. *See* Clofibrate
Ablation. *See* Catheter ablation
ABMS (American Board of Medical Specialties), 3:2188, 5:3553, 3554
Abnormal pain, 4:3229, 5:3237
ABO blood group system, 1:675, 680*t,* 681–682
  bone marrow transplantation, 1:713
  erythroblastosis fetalis, 2:1612–1613
  transfusions, 6:4397
ABO incompatibility disease, 2:1612–1615
Abolic. *See* Anabolic steroids
Abortion
  bacterial vaginosis after, 1:570
  complications, 1:9, 13
  first trimester, 1:10–12
  missed, 4:2889, 2890
  partial birth, 1:6–8
  second trimester, 1:12
  selective, 1:8–9, 4:2942
  therapeutic, 1:9–13, *10,* 4:2866–2867
Abortive polio, 5:3476–3477, 3478
ABPA (Allergic bronchopulmonary aspergillosis), 1:**134–136,** 498, 499, 500
ABR (Auditory brainstem response), 1:34
Abrasions, 1:13, 6:4687, 4688, *4688*

ABS (American Board of Surgery), 5:3553
Abscess, 1:*13,* **13–15**
amebic, 1:185
anorectal, 1:264–265, 271, 3:1746
brain, 1:732–733, 4:3085, 3167, 3205
neurosurgery, 4:3074
papilledema from, 5:3278
seizures from, 5:3889
carbuncles, 1:692, *692,* 693
causes
acute lymphangitis, 1:52
anaerobic infections, 1:213–215
Bartholin's gland cyst, 1:591, 592
coccidioidomycosis, 2:1056
Crohn's disease, 2:1224
diverticulitis, 2:1395–1396
empyema, 2:1530–1531
epididymitis, 2:1584
lymphadenitis, 4:2693
lymphogranuloma venereum, 4:2702
mastoiditis, 4:2780
melioidosis, 4:2810
piercing and tattoos, 5:3412
staphylococcal infections, 5:4119, 4121
central nervous system, 2:891–892
liver, 2:1420
lung, 1:14, 4:2659–2662
lymphogranuloma venereum, 4:2703
pancreatic, 5:3266, 3267
spleen, 5:4095
tooth, 5:3810, 6:4359
treatment, 1:**15–17,** *16,* 2:1279
tubo-ovarian, 5:3314, 3316
Absence (petit mal) seizures, 2:1589, 5:3888
Absidia sp., 4:2923
Absolute CD4+ lymphocyte count, 1:107, 110
Abstinence, 1:55, 59, 125
Abstract thinking, 2:1303
Abstract/visual reasoning, 5:4116
Abuse, 1:**17–20**
elder, 1:18–19, 20, 2:1477–1478, 5:3508
psychological, 1:19, 597, 2:959–965, 960*t,* 963–964, 1477
See also Alcohol abuse; Child abuse; Physical abuse; Sexual abuse; Substance abuse
ABVD regimen, 3:2132
Acamprosate, 1:125
Acanthamoeba sp., 2:1169
Acanthamoeba keratitis, 3:2466
Acanthosis nigricans, 3:2380, 2382
Acarbose, 1:357–358, 2:1350
ACB (Antibody-coated bacteria), 5:3656
Accelerated silicosis, 5:3983
Accidental death, 2:1276, 3:1974
Accidental drug overdose, 2:1409, 1412
Accidents, motor vehicle. *See* Motor vehicle accidents
Acclimatization, 1:165
Accolate. *See* Zafirlukast
Accomodation, 2:872
