Abstract

In this paper we introduce a lower bound estimates for approximation by neural networks in L_p spaces for $p < 1$.

Keywords

Neural networks, modulus of smoothness, direct theorem.

1. Introduction

In [3,5,6], the authors proved inverse theorems for the approximation by neural networks of continuous functions on \mathbb{R}^d using the 1st order modulus of continuity. There is a natural question can we improve the above estimates in terms of the k th order modulus of smoothness for k variate functions in L_p spaces for $p < 1$? in this article we answer this question.

Let N be the set of nonnegative integers numbers, \mathbb{R}^d be the d -dimensional Euclidean space ($d \geq 1$), $x = (x_1, x_2, \dots, x_d) \in \mathbb{R}^d$, $R_n^\sigma(d)$ the set of all polynomials of the form

$$\sum_{\lambda \in l(N \cup \{0\})^d} a_\lambda \sigma(-\lambda x + b_\lambda) \quad (l > 0).$$

, $\sigma: \mathbb{R} \rightarrow \mathbb{R}$, and let $|k|$ th order partial derivatives of f as

$$(d \geq 1), x = (x_1, x_2, \dots, x_d) \in [2]$$

A Korovkin's kernel $u_n(x)$, defined by

$$\sum_{\lambda \in l(N \cup \{0\})^d} a_\lambda \sigma(-\lambda x + b_\lambda) \quad (l > 0),$$

where $u_n(x) \in T_n(1)$, $u_n \geq 0$ and $\int_{-\pi}^{\pi} u_n(x) dx = 1$, where $T_n(1)$ is the space of all triangular trigonometric polynomials of degree less than n , $t_n(x) = \arccos(nx)$, $t_n(x)$ is called Chebyshev polynomial. Define the d -product of $u_n(x)$ as follows

$$V_n(x_1, x_2, \dots, x_d) = \overbrace{u_n(x) \times u_n(x) \times \dots \times u_n(x)}^{d \text{ times}} \in T_n(d)$$

$$, \text{ also } V_n \geq 0, (2\pi)^{-d} \int_{(-\pi, \pi)^d} V_n(x) dx = 1. [4]$$

We can define the K -functional as follows :

$$K_r(f, t^r) = \inf_{g \in A.C.loc} \left\{ \|f - g\| + t^r \sup_{|m|=r} \|D^{[m]} g\| \right\}$$

where $g \in A.C.loc$ means that g is $|m|$ times differentiable and $D^{[m]} g$ is continuous in the finite

set [5]. Bernstein inequality can be written as

$$\|P_n^k\|_p \leq c(p) n^k \|P_n\|_p.$$

1.1. Definition [4] let Q be metric space with metric d then if $f \in L_p(Q)$, given a direction $e \in \mathbb{R}^d$, the r th order Symmetric difference of f defined by

$$\Delta_h^r f(x) = \sum_{i=0}^r (-1)^{r-i} \binom{r}{i} f(x + \left(\frac{r}{2} - i\right) h e)$$

and the r th modulus of smoothness of a function f have the form

$$\omega_r(f, t)_p = \sup_{x \pm \frac{he}{2} \in Q, |h| \leq t} \|\Delta_h^r f(x)\|_p.$$

2. Auxiliary results

In this section we shall introduce some results that we need in our proof of the main result.

2.1. Lemma [7] a positive sequences $\{a_n\}$, $\{b_n\}$, if $(p > 0)$, and

$$a_n \leq \left(\frac{k}{n}\right)^p a_k + b_k \quad (1 \leq k \leq n) \quad \forall n \in \mathbb{N} \quad (1)$$

Then

$$a_n \leq C_p n^{-p} \left\{ \sum_{k=1}^n k^{p-1} b_k + a_1 \right\}. \quad (2)$$

2.2. Theorem [7] If $f \in L_p(\mathbb{R}^d)$,

$$K_r(f, t^r)_p = \inf_{g \in L_p^{(m)}} \|f - g\|_p + \sup_{|m|=r} \|D^{[m]} g\|_p,$$

Then

$$c(p) K_r(f, t^r)_p \leq \omega_r(f, t)_p \leq c(p) K_r(f, t^r)_p,$$

where $c(p)$ is a positive constant depending on p , and it may different from one line to other.

2.3. Theorem [1] Let $f \in L_p([0, 1]^d)$ and $n \in \mathbb{N}$, then there is a nearly exponential type of forward neural networks, and let $R_n^\sigma(d)$ as defined above, its number of hidden layer components is

$$M_n \geq \min_{C < \infty} (n+1)^d,$$

(where $C = c(p, d) \omega(f, \frac{1}{n})_p$), n is any integer satisfy

$$d_p(f, R_n^\sigma(d)) \leq c(p, d) \omega_r(f, \frac{1}{n})_p.$$

2.4. Proposition [4] assume that for the nonnegative sequences $\{a_n\}$, $\{b_n\}$, satisfied $b_k \leq (1 + \frac{1}{k})^p b_{k+1}$, and the inequality

$$a_n \leq C n^{-2} \left\{ \sum_{k=1}^n k b_k + \epsilon \right\}$$

Holds for $n \in \mathbb{N}$, then one has

$$a_n \leq C(b_n + n^{-2}\epsilon).$$

Here $C \geq 1$ is a constant and ϵ is a constant independent of n , k

3. The main results

In this article we introduce our main results

3.1. Theorem let K be a compact subset of \mathbb{R}^d and $f \in L_p(K)$. Then there is a nearly exponential type of forward neural network with hidden components number $m_n \geq \min_{(c \in \mathbb{N})} n^d$, where $c = c(p) \omega_v(f, \frac{1}{n})_p$. And $\epsilon \in \mathbb{N}$, such that

$$\omega_v(f, \frac{1}{n})_p \leq c(p) \frac{1}{n^v} \left(\sum_{k=1}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right)$$

Proof we have

$$\begin{aligned} \|L(V_n, f)\|_p &= \left\| (2\pi)^{-d} \int_{[-\pi, \pi]^d} f(x-t) V_n(t) dt \right\|_p \\ &= \left(\int_{[-\pi, \pi]^d} \left| (2\pi)^{-d} \int_{[-\pi, \pi]^d} f(x-t) V_n(t) dt \right|^p dx \right)^{\frac{1}{p}} \\ &\leq c(p) \|f\|_p \left(\frac{1}{(2\pi)^d} \int_{[-\pi, \pi]^d} V_n(t) dt \right) = c(p) \|f\|_p \end{aligned}$$

Therefore

$$\|D^{|v|} L(V_n, f)\|_p \leq c(p) \|D^v f\|_p \quad (1)$$

Then using Bernstein inequality we get

$$\|D^{|v|} L(V_n, f)\|_p \leq c(p) n^{|v|} \|f\|_p \quad (2)$$

Now let, $A_n = \frac{1}{n^{|v|}} \|D^{|v|} L(V_n, f)\|_p$, $B_n = \|L(V_n, f) - f\|_p$

. Then using (1) and (2) to get

$$A_n = \frac{1}{n^{|v|}} \|D^{|v|} L(V_n, f)\|_p \text{ for } n > k \geq 1,$$

we have

$$\begin{aligned} A_n &= \frac{1}{n^{|v|}} \|D^{|v|} L(V_n, L(V_k, f) - L(V_k, f) + f)\|_p \\ A_n &\leq c(p) \frac{1}{n^{|v|}} (\|D^{|v|} L(V_n, L(V_k, f))\|_p + \|D^{|v|} L(V_n, f - L(V_k, f))\|_p) \\ &\leq c(p) \frac{1}{n^{|v|}} \|D^{|v|} L(V_k, f)\|_p + c(p) \frac{1}{n^{|v|}} n^{|v|} \leq c(p) \left(\frac{k}{n}\right)^{|v|} A_k + c(p) B_k \end{aligned}$$

Then for $p=|v|$ in Lemma 2.1, we get

$$A_n \leq c(p) n^{-|v|} \left(\sum_{k=1}^n k^{|v|-1} B_k + A_1 \right),$$

and

$$\|D^{|v|} L(V_n, f)\|_p \leq c(p) n^{-|v|} \left(\sum_{k=1}^n k^{|v|-1} \|L(V_k, f) - f\|_p + \|f\|_p \right)$$

Then for $n \geq |v|$, there is a natural number m satisfy $n / |v| \leq m \leq n$.

Then

$$\|f - L(V_m, f)\|_p \leq \|f - L(V_k, f)\|_p \quad \frac{n}{|v|} \leq k \leq n.$$

Then using definition of K -functional to obtain

$$K_{|v|}(f, t^{|v|}) = \inf_{D^{|m|} g \in L_p^{|m|}} \left\{ \|f - g\|_p + t^{|v|} \sup_{|m|=|v|} \|D^{|m|} g\|_p \right\},$$

and

$$K_{|v|}(f, \frac{1}{n^{|v|}})_p \leq \|f - L(V_m, f)\|_p + \frac{1}{n^{|v|}}$$

$$\begin{aligned} &\leq \frac{c(p)}{n^{|v|}} \sum_{\frac{n}{|v|} \leq k \leq n} k \|f - L(V_k, f)\|_p \\ &+ \frac{c(p)}{n^{|v|}} \left(\sum_{k=1}^n k^{|v|-1} \|L(V_k, f) - f\|_p + \|f\|_p \right) \\ &\leq \frac{c(p)}{n^{|v|}} \left(\sum_{k=1}^n k \|L(V_k, f) - f\|_p + \|f\|_p \right) \\ &\leq \frac{c(p)}{n^{|v|}} \left(\sum_{k=1}^n k d_p(f, P_k(d)) + \|f\|_p \right) \end{aligned}$$

Then using Theorem 2.2 to obtain

$$\omega_{|v|}(f, \frac{1}{n})_p \leq c(p) \frac{1}{n^{|v|}} \left\{ \sum_{k=1}^n k (d_p(f, R_k^\sigma(d)) + \epsilon) + \|f\|_p \right\}$$

which is true for any ϵ .

Therefore

$$\omega_{|v|}(f, \frac{1}{n})_p \leq c(p) \frac{1}{n^{|v|}} \left\{ \sum_{k=1}^n k (d_p(f, R_k^\sigma(d)) + \|f\|_p) \right\}$$

To know the number of neurons in the hidden layer, we must choose n smallest integer larger than ϵ^{-1} . So we must choose $m_n \geq \min_{(c \in \mathbb{N})} n^d$, where $c = c(p) \omega_v(f, \frac{1}{n})_p$ \square

3.2. Theorem let K be a compact subset of \mathbb{R}^d and $f \in L_p(K)$. Then, $d_p(f, R_n^\sigma(d)) = O(n^{-\alpha})$, if and only if $f \in \text{Lip}(\alpha)$, where $\text{Lip}(\alpha) = \{f: \omega_r(f, t) = O(t^\alpha), \alpha \in (0, 1]\}$

Proof: first let us assume $d_p(f, R_n^\sigma(d)) = O(n^{-\alpha})$.

From Theorem 3.1 we have

$$\begin{aligned} \omega_r(f, \frac{1}{n})_p &\leq c(p) \frac{1}{n^r} \left(\sum_{k=1}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right) \\ &\leq c(p) \frac{1}{n^r} \left(\sum_{k=1}^n k \frac{1}{n^\alpha} + \|f\|_p \right) \\ &= c(p) \frac{1}{n^r} \left(\frac{n(n+1)}{2} \frac{1}{n^\alpha} + \|f\|_p \right) \\ &= c(p) \frac{1}{n^r} \left(\frac{1}{n^{\alpha-2}} + \|f\|_p \right) \\ &\leq c(p) \left(\frac{1}{n^{2\alpha-2}} + \frac{1}{n^\alpha} \right) \\ &\leq c(p) \frac{1}{n^\alpha}. \end{aligned}$$

Now for the opposite side we have, for $f \in \text{Lip}(\alpha)$, that

$$\omega_r(f, \frac{1}{n})_p = O\left(\frac{1}{n^\alpha}\right). \text{ Using Theorem 2.3 to have}$$

$$\begin{aligned} d_p(f, R_n^\sigma(d)) &\leq c(p, d) \omega_r(f, \frac{1}{n})_p \\ &\leq c(p, d) \frac{1}{n^\alpha} \quad \square \end{aligned}$$

3.3. Theorem let K be a compact subset of \mathbb{R}^d and $f \in L_p(K)$. if

$$d_p(f, R_n^\sigma(d)) \leq (1 + \frac{1}{n})^2 d_p(f, R_{n+1}^\sigma(d))$$

Then

$$\omega_r(f, \frac{1}{n})_p \leq c(p) \{d_p(f, R_n^\sigma(d)) + \frac{1}{n^2} \|f\|_p\}.$$

And

$$\begin{aligned} \omega_r(f, \frac{1}{n})_p &\leq c(p) \frac{1}{n^2} \|f\|_p \leq d_p(f, R_n^\sigma(d)) \\ &\leq \left(\frac{1}{2} + \frac{\pi^2}{4} \sqrt{d}\right) \omega_r(f, \frac{1}{n})_p. \end{aligned}$$

Proof:

Using Theorem 1.3, we have

$$\omega_r(f, \frac{1}{n})_p \leq c(p) \frac{1}{n^2} \left(\sum_{k=1}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right).$$

Then using proposition 2.4 with

$A_n = \omega_r(f, 1/n)_p$ and $B_k = d_p(f, R_k^\sigma(d))$ and $E = \|f\|_p$ we get

$$\omega_r(f, \frac{1}{n})_p \leq c(p) \frac{1}{n^2} \left(\sum_{k=1}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right) \leq c(p) (d_p(f, R_n^\sigma(d)) + n^{-2} \|f\|_p)$$

$$\leq c(p) ((1+1/n) d_p(f, R_{n+1}^\sigma(d)) + n^{-2} \|f\|_p).$$

This completes the proof \square

3.4. Theorem If K is a compact subset of \mathbb{R}^d and

$$\omega_r(f, \frac{1}{n})_p \leq c(p) n^{2s-r} d_p(f, R_1^\sigma(d)) + c(p) n^{r-s} d_p(f, R_{[n^\delta]}^\sigma(d)) + c(p) \frac{1}{n^r} \|f\|_p$$

Proof. In Theorem 3.2 we have

$$\begin{aligned} \omega_r(f, \frac{1}{n})_p &\leq c(p) \frac{1}{n^r} \left(\sum_{k=1}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right) \\ &= c(p) \frac{1}{n^r} \left(\sum_{k=1}^{[n^\delta]-1} k d_p(f, R_k^\sigma(d)) + \sum_{k=[n^\delta]}^n k d_p(f, R_k^\sigma(d)) + \|f\|_p \right) \\ &\leq c(p) \frac{1}{n^r} (d_p(f, R_1^\sigma(d)) \sum_{k=1}^{[n^\delta]-1} k + d_p(f, R_{[n^\delta]}^\sigma(d)) \sum_{k=[n^\delta]}^n k + \|f\|_p) \\ &= c(p) (d_p(f, R_1^\sigma(d)) \frac{1}{n^r} \frac{([n^\delta]-1)[n^\delta]}{2} + d_p(f, R_{[n^\delta]}^\sigma(d)) \frac{1}{n^r} \frac{n(n+1)}{2} + \frac{1}{n^r} \|f\|_p) \\ &\leq c(p) n^{2s-r} d_p(f, R_1^\sigma(d)) + c(p) n^{r-s} d_p(f, R_{[n^\delta]}^\sigma(d)) + c(p) \frac{1}{n^r} \|f\|_p \end{aligned}$$
